

Herat

A Socio-Economic and Demographic Profile

With the financial and technical assistance of UNFPA

Note

Some of the information contained in this report, in particular that related to crops and economic activities, as well as the building stock may not be as accurate as one would wish. However, they are the best estimates available at the time of the Household listing exercise. The most logical explanation is that the sources of the information—local informants—may not have been as knowledgeable as they were assumed to be.

*A Socio-Economic and Demographic Profile
Household Listing—2003*

Acknowledgements

The Socio-Economic and Demographic Profiles were a collaborative effort of UNFPA, the Central Statistics Office, and numerous stakeholders, who made suggestions for the improvement of the final product while it was still being written.

UNFPA wishes to recognize the contributions of Mr. David Saunders, its former representative in Afghanistan, who shared the various drafts of the model Profile with a number of donors, embassies, and other stakeholders stationed in Kabul and collected their suggestions as to how to improve on it.

The profiles could not have been completed without the commitment, enthusiasm and energetic efforts of many CSO staff members. Mr. Mohammad Haroon Aman, Mr. Waheed Ibrahimi, and Mrs Fazila Miri of the Database section produced all the tables and graphics for all 34 provinces. Mr. Tamim Ahmad Shakeb, head of the GIS section, and his colleagues, Messrs Zabiullah Aseel and Abdul Ahmad Sherzai, together produced all the thematic maps included in the body of the text as well as in the annexes—a total of more than 1,300 maps. Messrs Nasratullah Ramzi, Saifrahman Azizi, Sayed Yousuf Hashimi, and Zabiullah Omari of Database were responsible for editing the profiles and putting the last touches before printing

UNFPA also wishes to extend its appreciation to Mr. Abdul Rashid Fakhri, head of CSO, and his colleagues in the CSO review team—Messrs Esmatuallah Ramzi, Mohamed Sami Nabi, Azizullah Faqiri, and Ghulam Mustapha, who read the drafts and made valuable comments and suggestions, in particular with regards to the information on economic activities.

***Introduction by the
Acting General President of the Central Statistics Office of Afghanistan***

Designing programs aimed at increasing socio-economic development and economic growth to ensure better living conditions for population requires accurate, up-to-date, and comprehensive data. It has been 27 years since Afghanistan's first attempt to conduct a national population census. For reasons known to all, such an attempt had to be aborted. In those 27 years, a number of changes took place, that were related to natural population growth, population movement, and redrawing of the boundaries of the country's administrative units, among others. Such changes need to be appraised and documented, in order to respond to the need for accurate information that is vital for development and reconstruction programs.

Both the Bonn agreement and the emergency Loya Jirga called for the conduct of a second national population and housing census. Jointly with UNFPA, CSO mobilized the required funds from the international donor community, and took charge of the complex task of planning for the census and upgrading the technical skills of the CSO staff that will be responsible for its conduct.

In spite of difficulties of various sorts, and at an enormous cost in terms of staff mobilization, CSO, with the financial and technical assistance of UNFPA, undertook the first phase of the population and housing census. The operation, including door numbering, household listing, updating the enumeration area maps, data entry, cleaning, and processing took less than four years. For the first time, digital maps were produced for all provinces, districts, and village locations.

CSO has the great pleasure of producing this publication, which presents the results of the first phase of the census. It provides such valuable information as population size and spatial distribution, age and sex composition, as well availability of certain facilities to the village populations. We hope that such information will be useful for the widest audience, in particular planners, researchers, and any one with an interest in population data.

Abdul Rashid Fakhri,
Acting General President
Central Statistics Office,
Islamic Republic of Afghanistan.

**Introduction by the
Representative of UNFPA**

Under the Bonn Agreement, the United Nations agreed to assist the Government of Afghanistan in conducting a Population and Housing Census, the first Census in Afghanistan since 1979. As a leader in population and development issues, the United Nations Population Fund (UNFPA) has been entrusted with this task for its decades of experience and expertise in providing technical and financial assistance in conducting population and housing censuses.

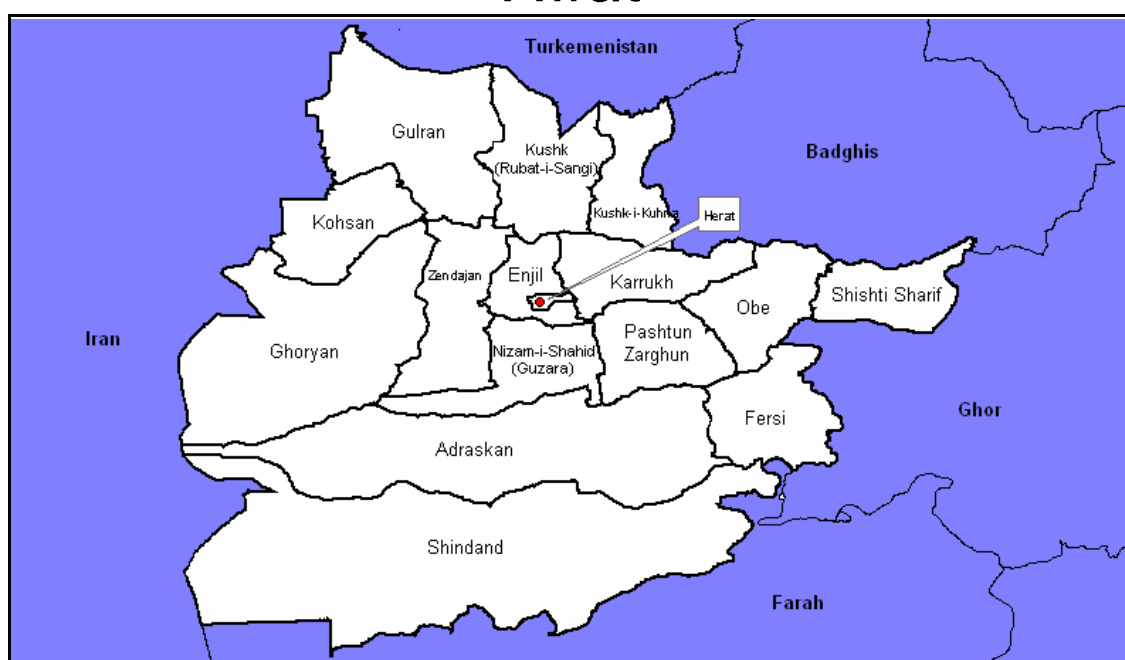

For the past few years, Afghanistan has been making serious attempts at rebuilding and rehabilitating the nation and its institutions after more than two decades of war, conflict, and civil strife. Effective planning for comprehensive social and economic development requires evidence based and reliable data. Data for economic and social development can come from various sources: sample surveys, administrative records, and various other sources. However, no data source other than a Population and Housing Census will provide primary information about the number and characteristics of Afghanistan's population. Likewise, the Census 2008 will allow for comprehensive gender analysis of population based indicators and will provide the baseline for population and any related functional projections that are crucial for planning.

The present publication deals with Phase I of the Afghanistan census—the Household Listing, conducted and the results analyzed between 2002 and 2005. The data collected during this exercise provides a wealth of information on basic population variables in the country — size of the population, age structure and sex composition, and household size. The household listing has also produced much socio-economic data on economic activities, health and education facilities, housing facilities and so on. All such information will be essential in the process of socio-economic reconstruction in Afghanistan. However, it must be noted that the household listing phase unfortunately could not be conducted in a small number of districts due to the security situation that prevailed then. It is hoped that the census proper, scheduled for the summer 2008 and being a benchmark under the London Compact, will encounter more favorable circumstances and fill the gaps left by the Household Listing exercise. UNFPA will extend all possible assistance to the Government of Afghanistan in order to make the census operation in 2008 a successful one. There are a number of positive aspects, which are important to note in the context of conducting the household listing, particularly noteworthy is the cooperation, which the Central Statistical Office has received from the Provincial Administrations, and the assistance, which has been extended to the CSO staff in all of the provinces. The enthusiasm of all of the staff to undertake very difficult work in exceptionally difficult conditions is equally noteworthy and appreciated, as is the quality of the work. At this point, I would like to extend my gratitude and recognition to Dr. Hamadi Betbout, UNFPA's senior advisor who led the exercise of managing the household listing database and publication of the provincial profiles.

Settlement Patterns

Located in the Western Region, Hirat is bordered by three provinces and two countries—Badghis to the northeast, Ghor to the east, Farah to the south, Iran to the west, and Turkmenistan to the north. It covers a land area of 55,869 squared kilometers, representing 8.56 percent of the total Afghan territory. It is the second largest province in the country, after Hilmand. The province is divided into 16 districts—the provincial center, Hirat, Injil, Nizam-I-Shahid (Guzara), Pashtun Zarghun, Karrukh, Kushk (Rubat-I-Sangi), Gulran, Kohsan, Ghoryan, Zendajan, Adraskan, Shindand, Fersi, Obe, Christi Sharif, and Kushk-I-Kunha.

Hirat is home to 7.6 percent of the total population of Afghanistan. With its 1,762,157 inhabitants, it is 2nd most populous province in the country, after Kabul (see Annex 1).

The population of Hirat is distributed among the 16 districts as shown in table 1 and figure 1¹. The provincial center, Hirat, concentrates 22.6 percent of the population, Injil houses another 12.7 percent, and Shindand 10.5 percent. Together, the three districts account for 45.8 percent of the total population in the province.

¹ Figure 1 is comprised of two panels; in addition to panel A which shows the distribution of the population by district, panel B shows the population density of each district. The latter information was included for conventional purposes only, as in the absence of quantified information on proportion of inhabitable land, density figures can be very misleading. Panel B should therefore be interpreted with caution.

The urban² population of Hirat represents 10 percent of the total urban population in the country. With its 457,278 urban dwellers, Hirat is the second most urbanized province in Afghanistan, after Kabul. The urban population is concentrated in six centers—Hirat, Ghoryan, Kushk, Obe, Karrukh, and Shindand³. Alone, the District of Hirat accounts for 87 percent of the urban population in the province. Ghoryan adds another 7.4 percent, so that together, these two districts concentrate more than 94 percent.

Table 1—Population, sex, and sex ratio, by district, province of Hirat, 2003⁴

District	Total		Males	Females	Sex ratio
	Number	Percent			
Provincial Center—Hirat	397,456	22.56	199,106	198,350	100.38

Kushk-I-Kuhna	41,642	2.36	20,973	20,669	101.47
Total	1,762,157	100.00	883,782	878,375	100.62

The rural population of Hirat is comprised of 1,304,879 inhabitants distributed over 2,170 settlements of extremely varying sizes. The smallest settlement counts as few as seven (3) people and the largest as many as 64,172⁵.

² Urbanity in Afghanistan is not based on population size. According to the Ministry of the Interior, are considered urban those places whose administrative structures include a municipality, regardless of their population sizes. In the case of Afghanistan all provincial capitals are urban, with the exception of Panjsher and Nooristan, as well as the capitals of some districts.

³ Hirat is divided into 10 *nahias* and Ghoryan into four. The other four districts are comprised one *nahia* each.

⁴ Enumeration started on 11 August 2003 and ended on 7 November of the same year.

⁵ There are three villages with zero population. Such villages appear to exist all over the country. According to CSO, this is due to a variety of reasons:

1. During the household operation, some villages were unoccupied because of the draught which caused the inhabitants to relocate in other places where more water was available;
2. Some of the villages were comprised solely of shops, serving the neighboring villages;
3. In some areas, remoteness as well as economic and other types of problems forced the villagers to relocate to other places;
4. In some cases, the villages are mere district centers with no other types of buildings than government offices and shops.
5. Some villages had been partially demolished, which drove the inhabitants away.

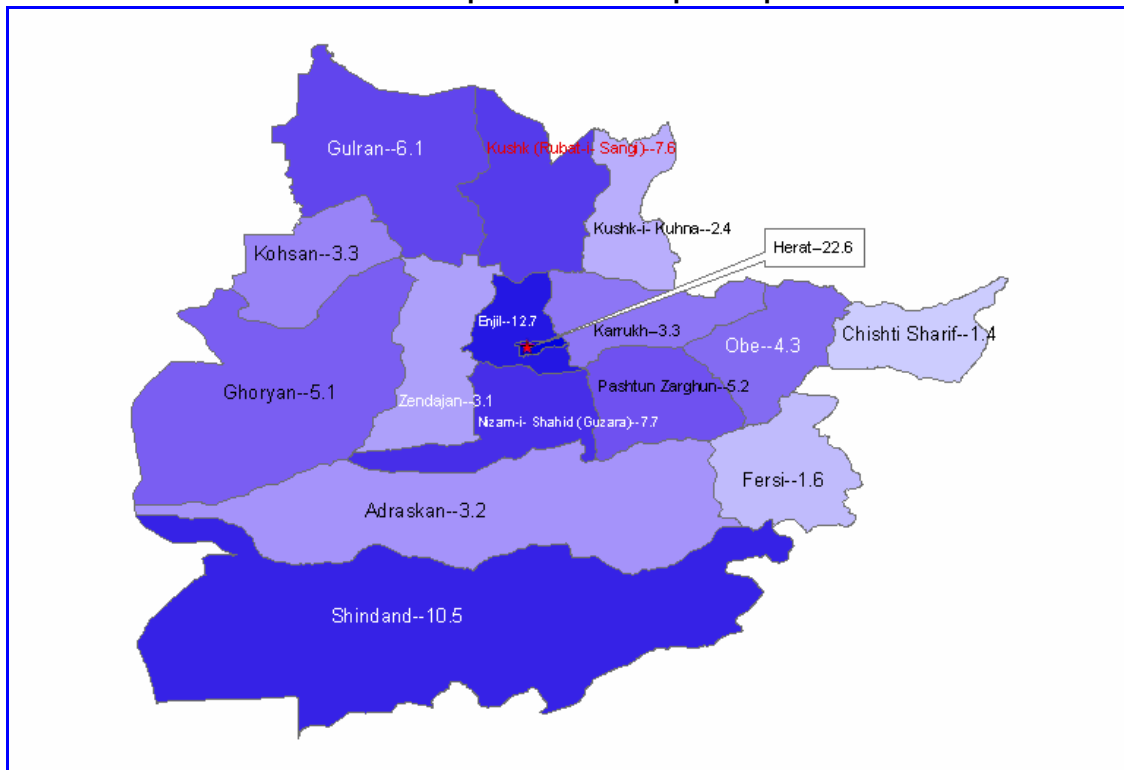

Figure 2 shows the distribution of the village population by size-class in the total province (panel A) and in each individual district (panel B).

At province level, the distribution is not as heavily skewed towards villages of very small sizes as in other provinces—Wardak, Logar, Bamyan, etc. On the contrary, the most remarkable feature of the spatial pattern of Hirat is the large number of villages with 1,000 population or more: 332 out of the total 2,170, i.e., 15 percent. It is only surpassed by the proportion of villages with 100-199 population, which represents 17 percent of the total (370 villages). At the bottom of the distribution, villages, with less than 100 population number only 225 and represent a little more than 10. This category of settlements is even smaller than the ones immediately above it, i.e., villages with 100-199 population, 200-299, and 300-399. Overall, the average village in Hirat has about 400 inhabitants.

The distributions by districts exhibit little variation—out of the 16 districts, 10 are very similar; what they have in common is a relatively big proportion of large-sized villages. This group of districts is comprised of Injil, Nizam-I-Shahid, Pashtun Zarghun, Kushk, Kohsan, Gulran, Ghoryan, Zendajan, Shindand, and Obe. In six of the 10 districts, the proportion of large-sized villages is even the biggest; it ranges from 18 percent to as much as 40 percent. In the remainder of the districts, the distributions assume the shape of a population pyramid with a large base; even though in some cases departures from the overall shape of a pyramid are obvious.

Demographic Characteristics

Age distribution

The distribution by age and sex of the population of Hirat is shown in table 2 and figure 3. As the latter clearly shows, the distribution is highly irregular. The overall shape of the age-pyramid is typical of a pre-transition society—characterized by stable high fertility, but certain age groups are noticeably below the expected size. For instance, it is not readily understandable why the proportions of the 0-4 age groups for males should be that much lower than the corresponding proportions of the 5-9 and 10-14 age groups, or why the proportion of the 20-24 is so under-reported, in particular compared to the next age-groups. Other anomalies are also evident (see annex 5 for a comparison of the reported and adjusted age-distributions). While a deficit in the proportion of children below 10 could be a direct result of war casualties—women married to soldiers having given birth to fewer children than in normal circumstances, it is difficult to account for the under-estimation in the other age-groups.

The overall shape of the age-pyramid is typical of a pre-transition society—characterized by stable high fertility.

Clearly, in order for the age data to be useful to the planner, it needs to be adjusted.

“Errors in the tabulated data on age may arise from three different sources:

- *inadequate coverage,*
- *failure to record age, and*
- *misreporting of age.*

Coverage errors are of two types. Individuals of a given age may have been missed by the census or erroneously included in it (e.g. counted twice). The first type of coverage error represents gross

under-enumeration at this age and the second gross-over-enumeration. The balance of the two types of coverage errors represents net under-enumeration at this age¹.

In addition, the ages of some individuals included in the census may not have been reported, or may have been erroneously reported by the respondent, erroneously estimated by the enumerator, or erroneously allocated by the census office. Such errors are referred to as response bias.

Table 2—Population estimate, by age in 5-year groups and sex, Hirat, 2003²—Reported

Age Group	Male		Female		Both sexes	
	Number	Percent	Number	Percent	Number	Percent
0-4	146,996	16.63	170,119	19.37	317,115	18.00

Figure 3—Population pyramid, Hirat, 2003—Reported

¹ Because under-enumeration commonly exceeds over-enumeration; the balance is typically designated as under-enumeration.

² The age distribution is based on 1/200 sample of the total households.

Correction of the age distribution of the 2003 Household Listing poses certain challenges. In addition to the difficulties described above, one must take into account two additional factors:

1. excess mortality among certain age groups due to war, and
2. the waves of war refugees that left for neighboring countries.

It follows that, in any attempt to correct for the anomalies, care must be taken not to remove the true fluctuations that resulted from such factors.

To correct for these irregularities, we applied a multi-stage procedure³ that yielded the distribution shown in table 3 and figure 4⁴.

Table 3—Adjusted population estimate, by age in 5-year groups and sex, Hirat, 2003

Age Group	Male		Female		Both sexes	
	Number	Percent	Number	Percent	Number	Percent

Total	883,782	100.00	878,375	100.00	1,762,157	100.00

Household size and sex ratio

The sex ratio (number of males per 100 females) varies between 97.4 in Zendajan and 107.7 in Fersi, the average for the province being 100.6 (figure 5 below and the last column of table 1). There is no information that could explain why such a wide inter-district variation.

A typical household in Hirat has 5.8 persons, which is slightly below the national average of 6.3. Such a size is an indicator of a high fertility regime.

³ The complete account of the various stages is shown in Annex 2.

⁴ For a comparison of the reported and adjusted age-distribution, see annex 3.

Figure 4—Population pyramid, Hirat, 2003—Adjusted.

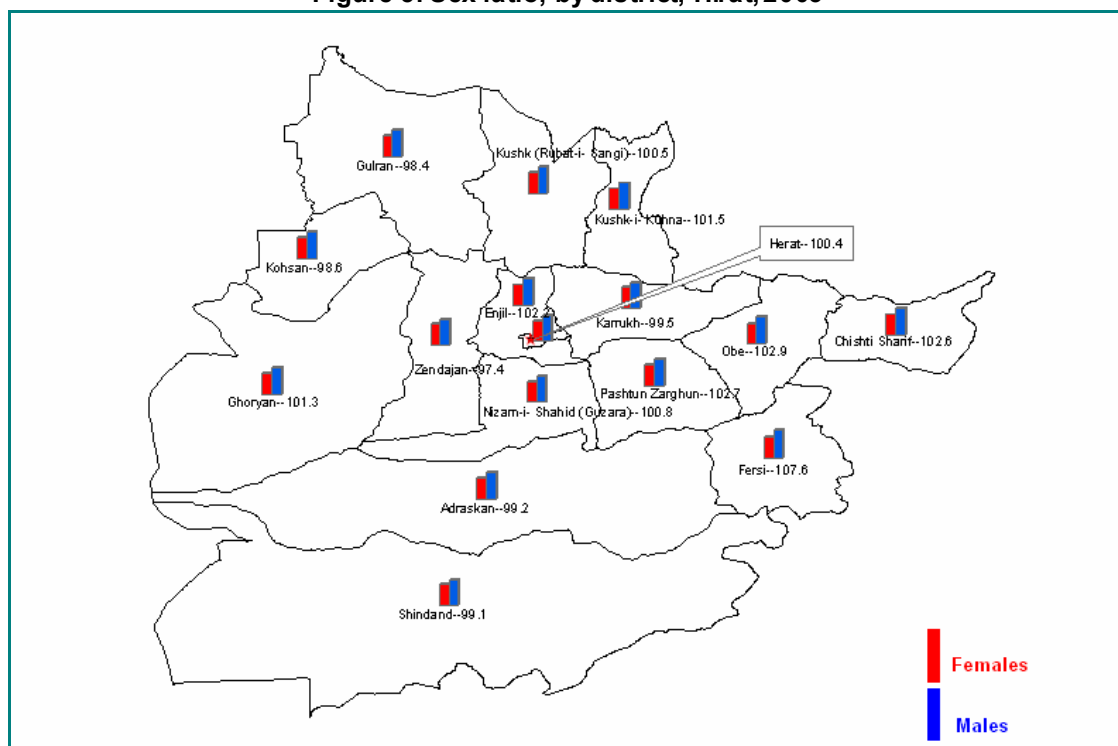

Figure 5. Sex ratio, by district, Hirat, 2003

Special age groups

Planners attach special interest to certain age groups. For fertility analysis, the total number of women 15 to 49 years of age—the childbearing ages—is more significant than

others; and the population 6 to 12—primary school ages—is important in educational research and planning, just to take these two examples. Table 4 presents data for the above age groups as well as for others, based on an interpolation of the adjusted five-year age distribution⁵.

Table 4—Special age groups by sex, in absolute numbers and percents, Hirat, 2003

Age	Male		Female		Both sex	
	Number	Percent	Number	Percent	Number	Percent
School age Population						
Primary — 6-12	192,912	22.6	187,149	21.8	380,061	22.2

*= Women in the child bearing ages

Main languages spoken

The Household Listing exercise did not collect any information on the ethnic background of the population. However, it included a question on the languages spoken by the majorities of the populations in the villages⁶. Of the seven languages listed (figure 6⁷), one—Dari—is spoken by 1,663 villages out of the 2,170, which represents more than three persons out of four. Pashto comes in second position, with 466 villages and 21.5 percent of the population. Together, these two languages are spoken by a 98 percent of the population and 97.7 percent of the villages. Languages spoken by the remaining minority are Turkmani and Uzbaki.

⁵ The breakdown of the five-year age distribution into single years of age was obtained using the Karrup-King Third-Difference formula.

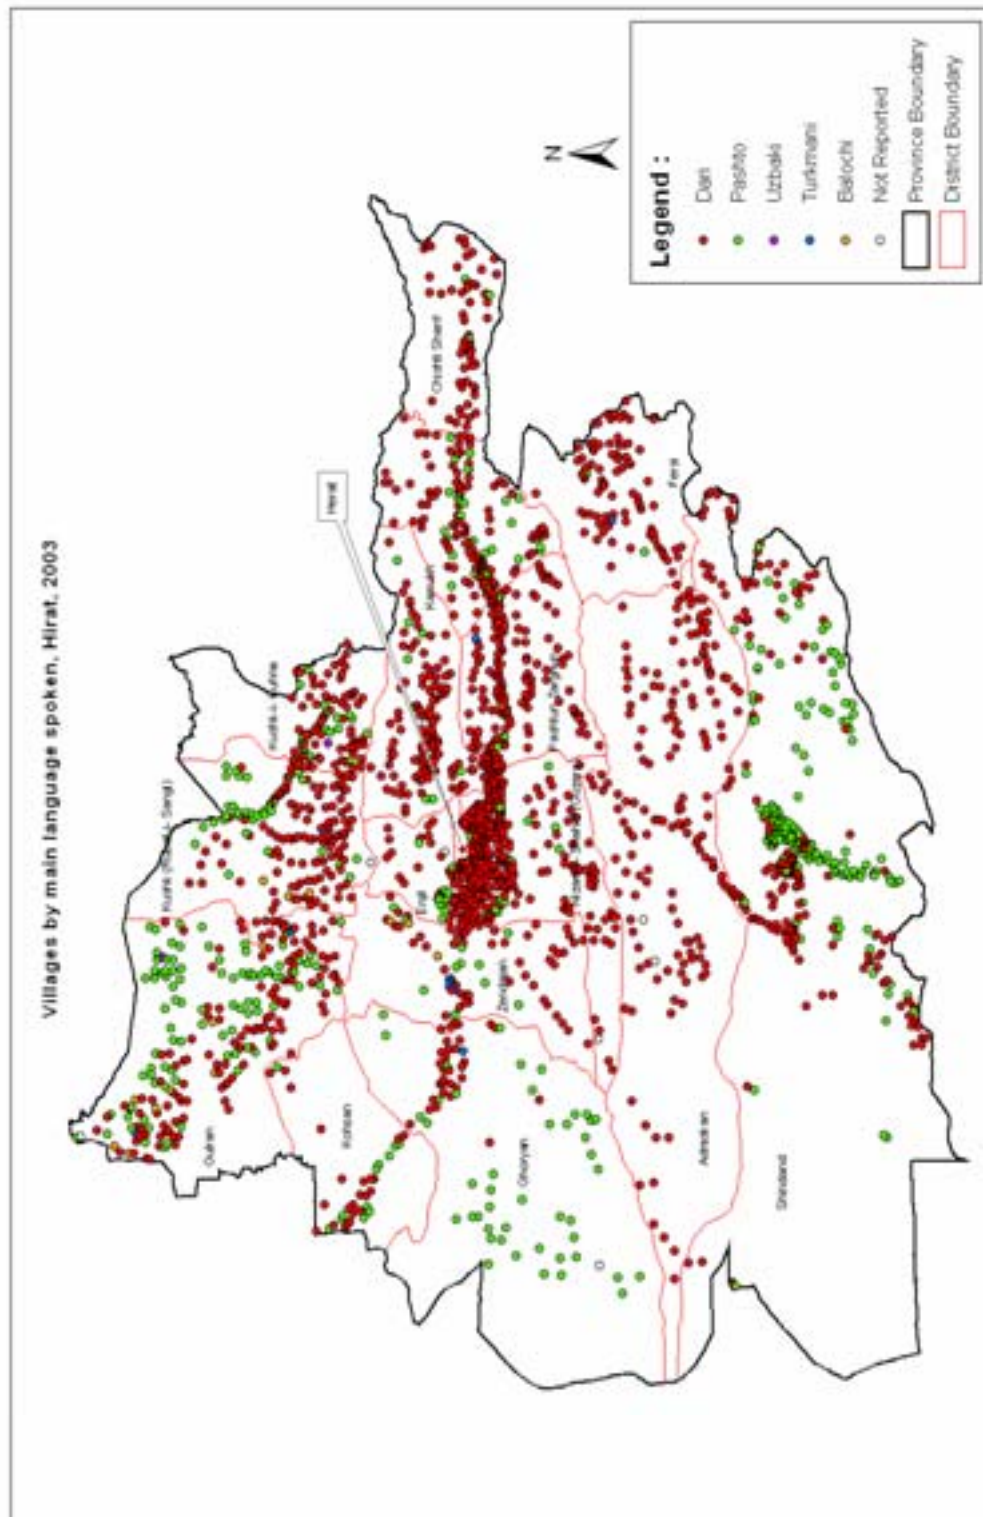

⁶ The question on language was not asked from the urban population.

⁷ A seventh categories includes all other, unspecified, languages

Figure 6—Population and villages, by main language spoken, Hirat, 2003

Map2

Other useful information collected during the Household Listing exercise concerned the locations of the villages with respect to their respective district centers, the types of roads, and the topography. Even though no information was obtained on the social situation of the population, the data collected at village-level make it possible to draw inferences on the availability and/or accessibility of such essential social services as literacy courses; rural schools; primary, secondary, and high schools; health centers and/or dispensaries; drugstores; public phones, mills, as well as radio and television.

Figure 7 shows the numbers of villages by the distances separating them from their respective district centers. Figures 8 and 9 show respectively the types of predominant topography, and the types of roads in terms of their accessibility by car.

The distribution by distances from the provincial centers clearly does not show a reasonable degree of accessibility with respect to those services that can only be provided by a district center, at least compared to other provinces. The proportions of the populations living in the district centers or within less than five kilometers is exactly 10 percent. Those that live 5-9 kilometers away from their district centers, represent about 14 percent. Together, they account for less than one-fourth of the population. Altogether, half of the population lives about 17 kilometers away from their respective district centers, and the other half at more than 17 kilometers. In addition, 439 villages and more than 176,000 population live isolated, at more than 50 kilometers from their district

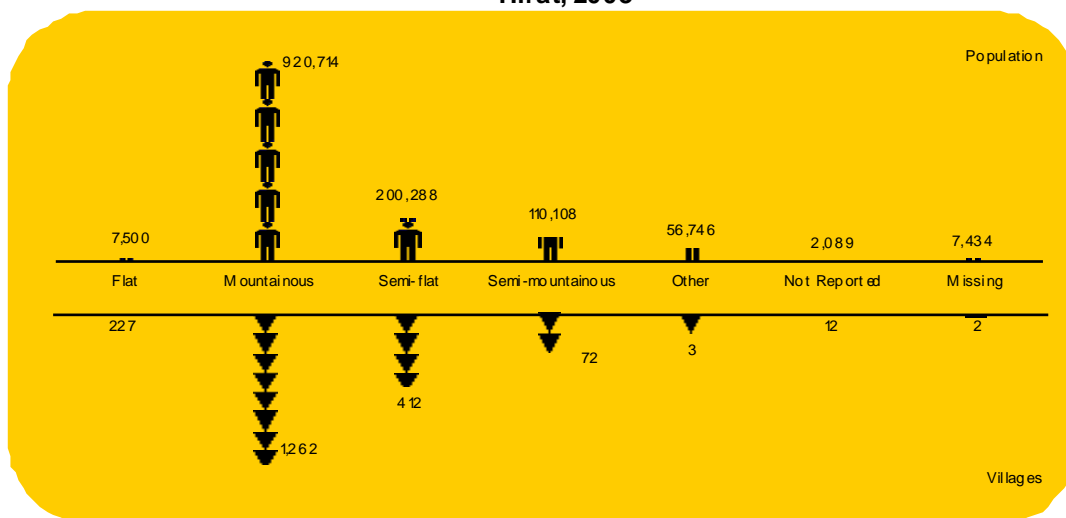

centers, including 108 villages and more than 51,000 population that are situated at more than 100 kilometers.

Figure 7—Population and villages, by distance from the district center, Hirat, 2003

These difficulties are compounded by the nature of the terrain and the availability of transportation. As figure 8 shows, of the 2,170 villages, only 5 are located on flat terrain. Those living in mountainous areas represent more than 70 percent of the population; and even though the rest of the population lives on semi-flat or semi-mountainous terrain, there is no indication that the nature of the terrain is such that access to the various services that the population may need is easy enough.

Figure 8. Population and villages, by topography of the village, Hirat, 2003

This is further reflected in the types of roads available (figure 9). Of the 2,170 villages, only 1,271, housing 69 percent of the rural population of Hirat are accessible by road at all year-round. More than a third of the villages (26 percent of the population) are accessible by car in some seasons, and the remainder—3.9 of the population and about 8.7 percent of the villages—don't have any roads at all.

Figure 9—Population and villages by type of road, Hirat, 2003

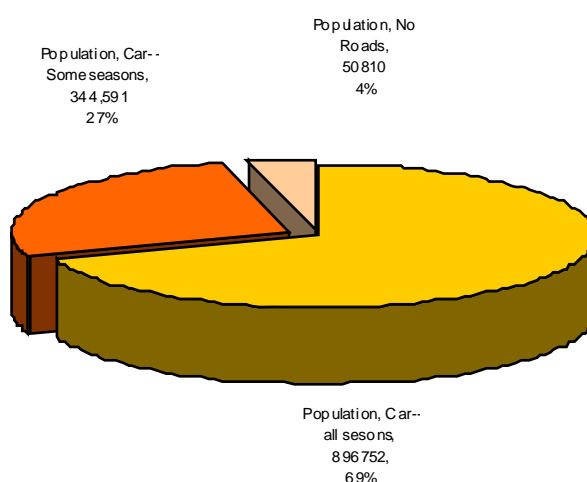

Figure 10 presents information on the distances separating villages from certain social services: schools, health centers, drugstores, post offices, public phones, and mills.

Educational services

Judging by the proportion of the population living less than five kilometers away from the closest school, accessibility of schools is highest for the primary, than for the secondary, than for high schools¹.

Primary schools exist in 411 villages out of the 2,170, which represents a comparatively high 21.9 percent. Students who must travel up to five kilometers to reach the closest

¹ Literacy courses and rural schools have been dropped from this analysis because of excessive rates of non-response—18.2 percent for literacy courses and 15.3 percent for rural schools. The most plausible explanation for such high non-responses rates would that respondents do not know the difference between an ordinary primary school and a rural school. As regards, literacy courses, they may not even know the meaning of the concept.

primary school represent close to two out of five. For more than three students out of five, therefore, access to a primary school can be considered as relatively easy. There is however a substantial proportion of students for whom access is quite difficult to the extent that they must travel more 10 kilometers to reach their schools—about 24 percent.

Secondary schools exist in 129 villages, which represents 5.9 percent of the population. Students who must travel up to five kilometers to reach the closest school represent 30 percent. But those that can be considered as isolated with respect to their secondary schools—more than 10 kilometers from the closest secondary school—represent 43 percent, as compared to 24 percent for primary schools.

For high schools, access appears to be less easy. This type of school exists in only 38 villages representing only 1.8 of the total. Students who must travel five kilometers or less to get to their high school represent 16.2 of the population. Another 14.2 percent must travel between five and 10 kilometers; but those who must cover longer distances—more than 10 kilometers—represent not far from two out of three.

Health services

The spatial distribution of the health infrastructure is more dispersed than for educational centers (panels F & G). Health centers exist in 57 out of the 2,170 villages, and dispensaries in 100. Drugstores exist in 156 villages. The proportions of the populations not having to travel outside their own villages to seek medical attention is only 4.6 percent for health centers, and 8.2 percent for dispensaries. As for drugstores, they are located in-village for about 11 percent of the population. Furthermore, health centers are located at less than five kilometers for only 17 percent of the population. The corresponding proportions for dispensaries and drugstores are respectively 18.5 percent and 20 percent. Overall, accessibility to health care, be it a health center, a dispensary or a drugstore, is rather difficult for large proportions of the population, inasmuch as more than half must travel more than 10 kilometers to get it.

Post office & public phones

Post offices exist in eight villages, and public phones in 15, servicing respectively 1.5 percent and each. Populations living at less than five kilometers from the closest post

office or public phone are 5.9 percent and 7.7 percent respectively. In sum, for 84 percent of the population, the closest post office is located at more than 10 kilometers. The corresponding proportion for public phones is close to four persons out of five.

Mills

Mills tend to be relatively more available to the populations than any of the facilities mentioned above (panel K). They exist in 980 villages out of the 2,170 and cater to the needs of 672,004 population, representing more than half of the inhabitants. Furthermore, 27.5 percent of the population don't have to travel more than five kilometers to reach the closest mill.

Radio & television

Access to radio is almost universal—98 percent of the populations either have a radio set or live in a village that has it. For TV, however, access is available for 55 percent of the population. This latter proportion, however, is considerably larger than in most of the other provinces, including the most urbanized ones. It goes without saying that public information efforts and media campaigns must take this fact into consideration.

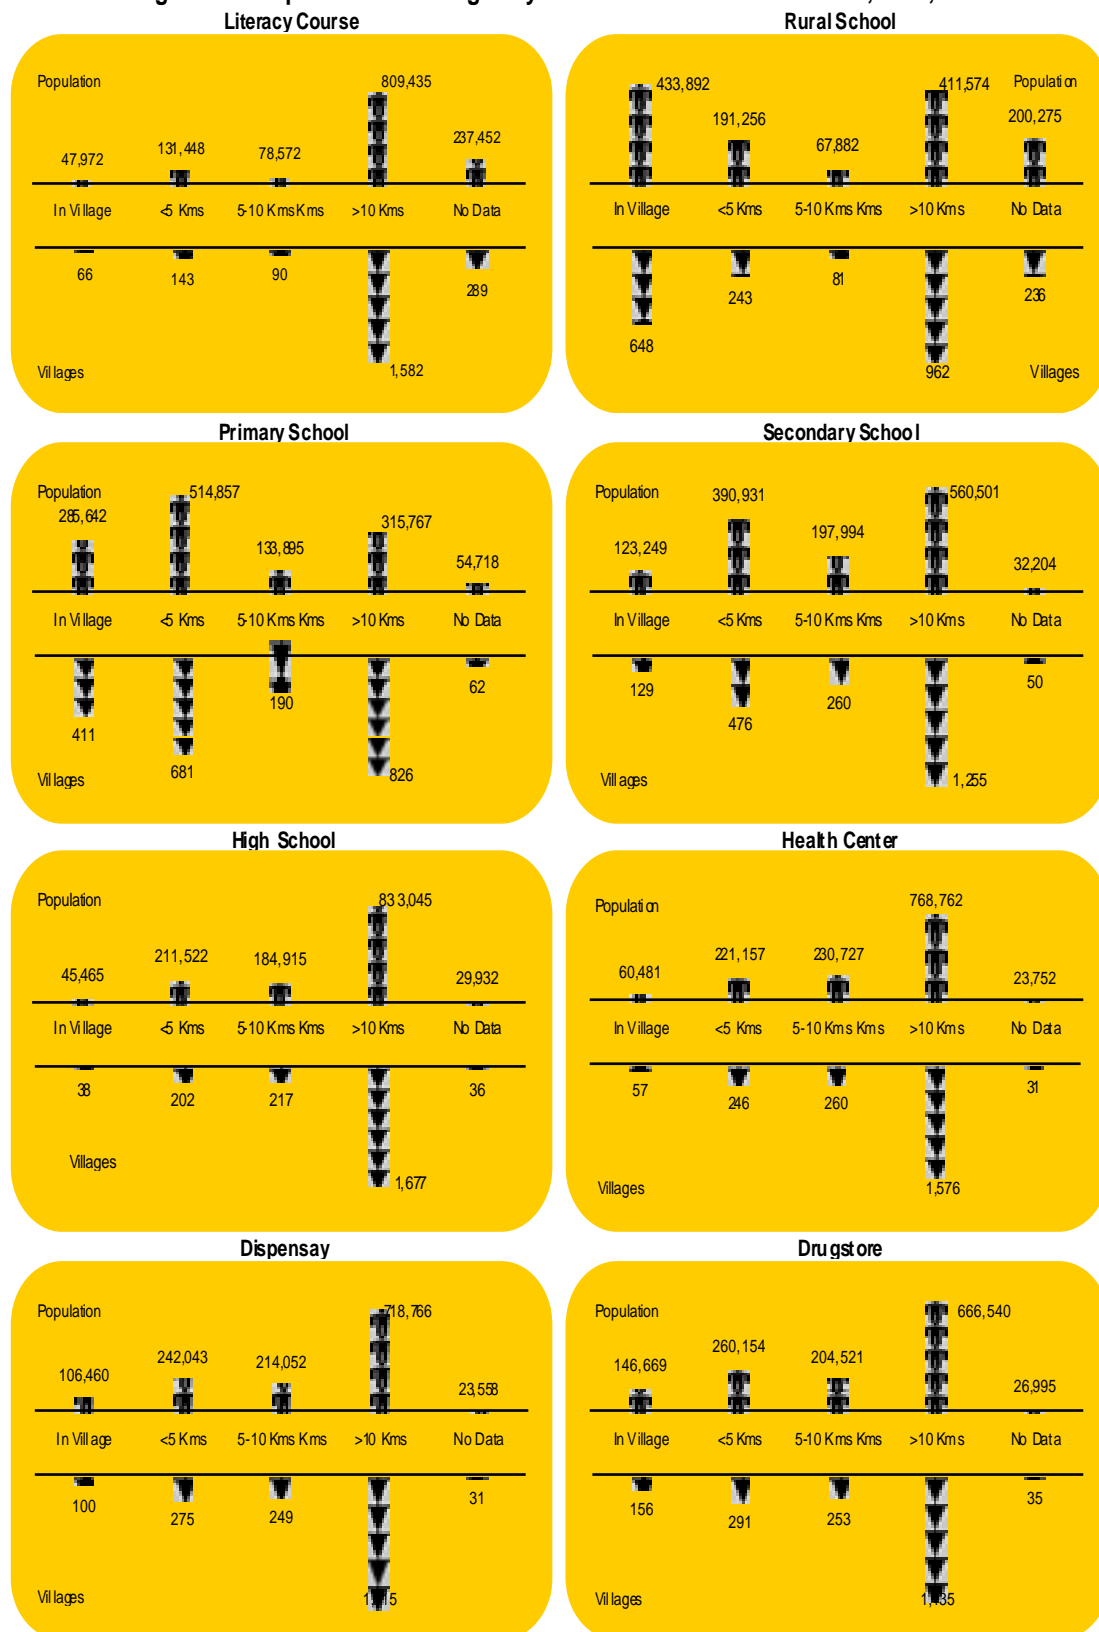

Figure 10—Population and villages by distance from certain facilities, Hirat, 2003

Map9

Map10

In addition to the major sources of irrigation water, the household listing included information on agricultural products, industrial products, handicrafts and small industries—a total of 64 items grouped into eight categories as shown in table 5 below.

Data on economic activities can be analyzed in various ways. The analysis presented here is based on a graphical depiction of the data. A more complex one is shown in annex 4, based on a technique called compositional analysis.

Table 5—Agricultural, industrial, and animal products, handicrafts and small industries, Hirat 2003

<i>Subsistence Crops</i>	<i>Industrial Crops</i>	<i>Fruits</i>	<i>Vegetables</i>	<i>Herbal Products</i>	<i>Handicrafts</i>	<i>Small Industries</i>	<i>Animal Products</i>

Other	Other	Other	Other	Other	Other	Other	Other

Agriculture

Figure 12 and panels A through F of figure 13 provide information on the sources of irrigation water and agricultural products—crops; fruit; vegetables; herbal, and animal products.

Figure 12 shows that all the various sources of irrigation water are used, except deep wells which tend to be rare—they are used in 15 villages only, and supply less than 10,000 population. Among the remaining sources, rivers are the most dominant; they are

used by 654 villages and more than 480,000 population; which amounts to 37 percent of the total population in the province and 30.5 percent of the villages. The second source in terms of size of population supplied is springs; they cater to the needs of 280,000 in 315 villages. The latter tend to be large-sized villages, which explains why springs rank only fourth in terms of number of villages supplied, after streams and conduits.

Figure 12—Population by source of irrigation water, Hirat, 2003

A cursory look at figure 13 shows that most of the economic activities are concentrated in a few districts, in particular, Shindand, Kushk, and Injil (see also annex 6).

Subsistence crops are mentioned 5,506 times. The two major crops grown are wheat and maize—they occupy close to 58 percent of all the villages. Overall, the major producers are Injil, Shindand, and Gulran: together they house not far from two villages out of every five producing any subsistence crops.

Out of the 5,506 villages producing wheat, 15 percent are located in Shindand, 11 percent in Gulran, and 10 percent in Injil. The same three districts are also major producers of maize; but two more districts are also just intensely engaged: Nizam-i-Shahid and Kushk. Overall, the districts most engaged in the production of subsistence crops are Injil, Nizam-i-Shahid, Shindand, Fersi, Gulran, Kushk-i-Kuhna, and Kushk, in that decreasing order of number of villages engaged in the production.

Vegetables were mentioned 2,368, i.e. 43 percent as frequently as subsistence crops. At province level, four of the seven specific produce are grown in a sufficiently large number of villages—683 for onion, 620 for potatoes, 582 for tomatoes, and 214 for carrots. The least frequent vegetable is leek, produced in 64 villages.

At district level, five districts stand out as major producers of vegetables—Injil, Nizam-i-Shahid, Kushk, Kushk-i-Kuhna, and Obe. Both Injil and Nizam-i-Shahid are engaged in all the vegetables; but Injil is particularly strongly associated with cauliflower (three villages out of every five producing this vegetables), spinach (46 percent of the villages), and, to a lesser extent, leek (almost one-third of the villages).

Kushk is engaged in six of the seven produce: all, except cauliflower. Kushk-i-Kuhna, Obe, and Shindand are comparatively major producers of potatoes, onion, tomatoes, and carrots. Shindand is also a major producer of leek, together with Injil, Nizam-i-Shahid, and Kushk.

Fruit are mentioned a little less frequently than vegetables—1,899, as compared to 2,368. The most frequent fruit by far are melon/water melons, produced in 939 villages, followed by grapes (377 villages), pomegranates (246 villages), and mulberry (166 villages). Oranges are the one fruit that is particularly scarce in Hirat; it is produced in a total of three villages out of the 1,899.

Again the major producers of the four major fruit are Injil, Nizam-i-Shahid, Shindand, and Obe. But other districts stand out as being major growers of one or more fruit. Pashtun Zargun is associated with grapes, walnuts, and mulberry; Kushk is associated with melons and mulberry; Gulran is associated with melons, and Chishti Sharif is associated with walnuts. With regard to melons, the most popular fruit, it is produced mostly in Gulran, Kushk, Injil, Obe, and Shindand. Together, these five districts house more than 58 percent of all the villages producing melons.

Hirat produces each of the even specific animal products in large numbers of its villages. The total number of times animal products are reported is 5,945, which is more villages than for subsistence crops. Overall, the largest producers are Kushk and Gulran: together

they house more than a third of the villages producing any of the seven products. Other districts—Injil, Nizam-i-Shahid, Zendajan, Obe, and Kushk-i-Kuhna are medium-size producers of several products.

Herbs are grown in few villages; they were mentioned 573 times. The major herb is caray, produced in 294 villages. Caray is produced mostly in Gulran (one-third of all the villages producing it), Kushk (19.4 percent), Kushk-i-Kuhna (11.6 percent), and Zendajan (10.2 percent).

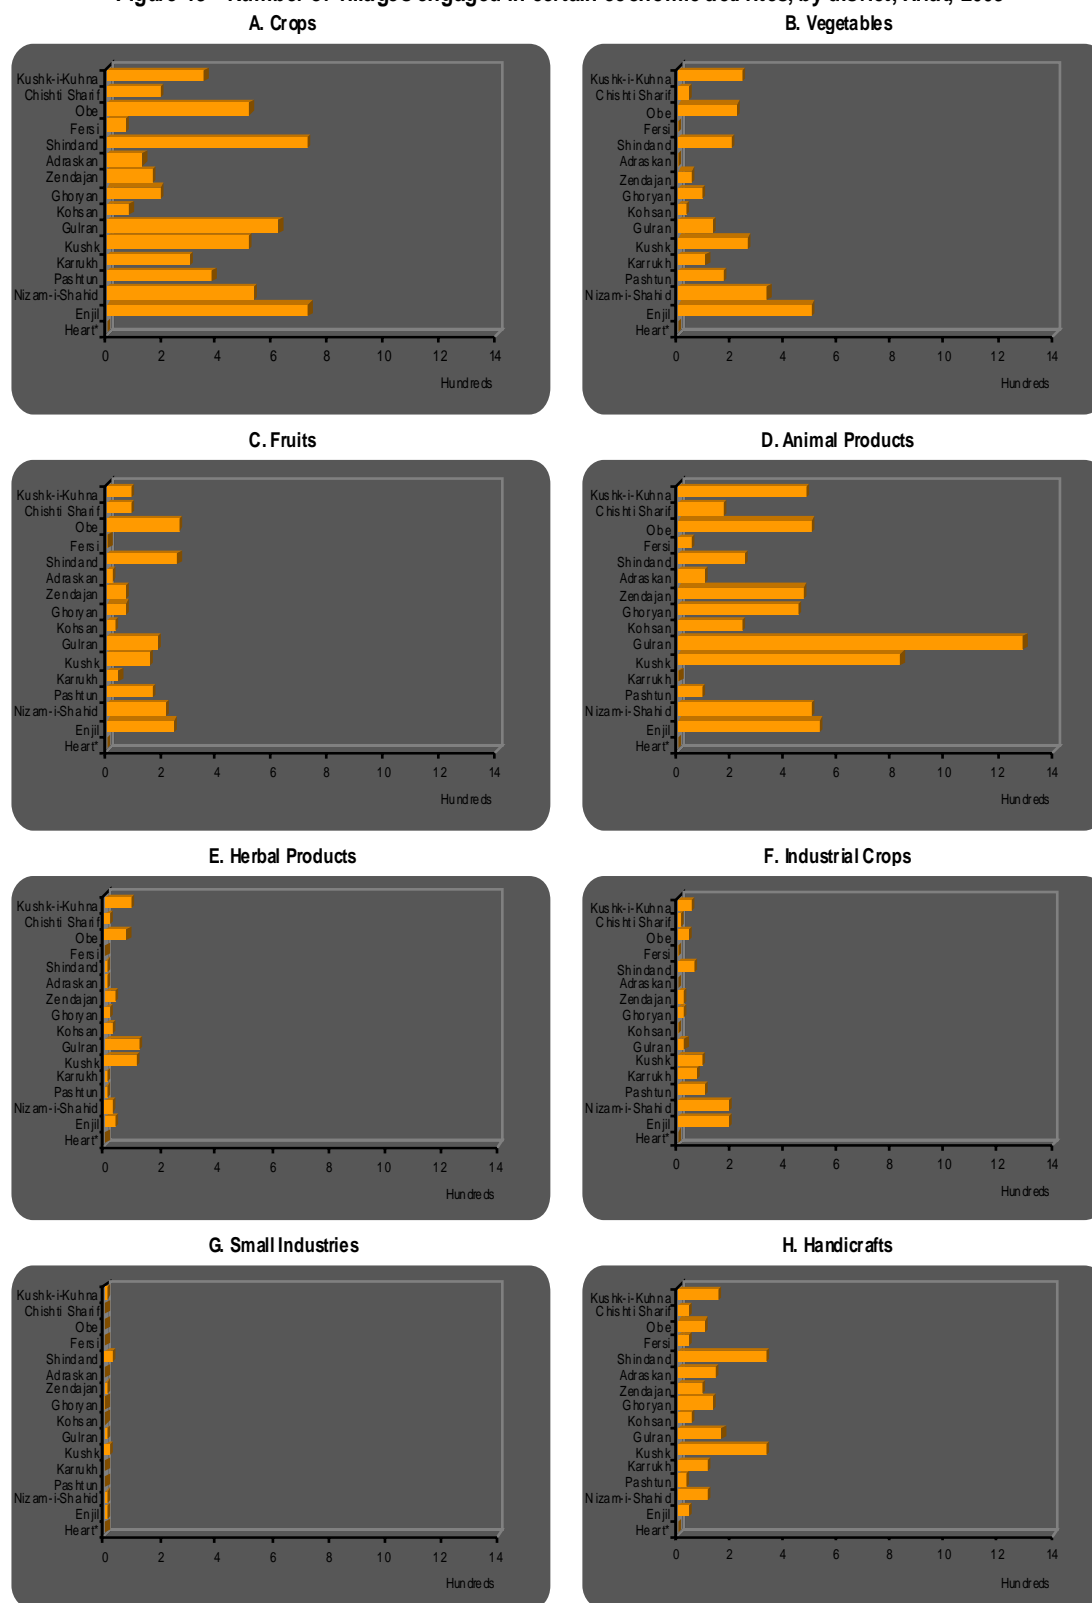

Industrial crops, small industries, and handicrafts

Unlike other provinces, Hirat produces industrial crops—cotton, sugar, sesame, tobacco, olives, and sharsham, etc.—in a relatively substantial number of villages: 903, as compared to 573 for herbs. The three major crops are cotton (362 villages), tobacco (248 villages), and sesame (169 villages). Together, these three products account for almost 86 percent of the industrial commodities produced in the province. Nizam-i-Shahid and Injil are major producers of all three major commodities. Together, they house 41.7 percent of all the villages producing cotton, 48 percent of the villages producing sesame, and 30.2 percent of the villages producing tobacco. Cotton is also produced in a large number of villages in Pashtun Zarghun, Karrukh, and Shindand; sesame in Kushk and Shindand; and tobacco in Karrukh, Kushk, and Kushk-i-Kuhna.

The sector of small industries in Hirat is not particularly well developed. Silk is produced in 15 villages, five of which are in Zendaja, and another five in Injil. Confection engages 16 villages, 12 of which are in Shindand. Sugar candy is produced in seven villages, five of which are in Shindand; and sugar sweets are produced in 10 villages, all of which are again in Shindand.

In the area of handicrafts, carpets and rugs are the most prominent: they engage more than 87 percent of 1,907 villages producing any handicraft items. Almost two out of every five rugs are produced in Kushk and Shindand. The same two districts produce carpets in more than third of villages; and Adraskan adds another 13.5 percent. Jewelry and shawls are produced mainly in Kushk, Gulran, and Obe.

Figure 13—Number of villages engaged in certain economic activities, by district, Hirat, 2003

* = Provincial Center

The Household Listing collected a large amount of data on the physical infrastructure in the provinces. A total of more than 300 different types of buildings were counted, that were later grouped into 17 categories—housing units, schools and educational institutions, mosques, mills, etc. (see figure 14).

The total number of buildings counted was 245,927 buildings in the whole province, three quarters of which (183,793 buildings) were housing units. The remaining quarter (62,134 buildings) represents the rest of the various types of buildings.

The number of buildings in a given locality is essentially a function of the size of the population living it. To control for this variable, we divided the total population by the number of buildings, thus obtaining a measure of the extent to which living space, amenities or services—social, economic or otherwise, are available to the population.

Housing units

As could be expected, the largest numbers of housing units are located in Hirat, the provincial center, Injil, and Shindand, the three most populous districts. In terms of persons per housing unit, the most crowded district is Obe, with 11 occupants in each housing unit, and the least crowded Fersi and Adraskan, with six occupants per housing unit in the former, and six in the latter. Among the remaining districts, variation ranges between nine and 10, in almost equal numbers of districts, the provincial average being 10.

Schools and educational institutions

There are 488 schools in the province of Hirat, 132 of which are located in the provincial center; another 65 are in Injil, the second largest district. To the extent that there is no information on the sizes of the schools, i.e., the numbers of classrooms in every school, it is difficult to draw any definitive conclusions as to class-density. From the information available, and assuming that schools would tend to be of approximately the same size, particularly in the less populated districts, one can group the districts into two categories with respect to their degrees of crowdedness. The first category is comprised of Fersi and Zendajan, where the average population per school is about 7,000. In the second category, the average density per school ranges from about 2,200 in Kushk-i-Kuhna to 4,100 in Ghoryan. At province level, density per school is about 3,600.

Health infrastructure

The health infrastructure includes hospitals, clinics, doctors' practices, and pharmacies.

There are 11 hospitals in Hirat; nine of which are located the provincial center, one in Injil, and another one in Shindand. The population density per hospital in these three districts are approximately 44,000; 225,000; and 185,000 respectively. On average, there is one hospital for every 160,000 population or so.

There are 137 clinics in the entire province of Hirat, more than a third of which (43) are located in the provincial center, 15 in Injil, 11 in Shindand, and 10 in Nizam-i-Shahid. Together, these four districts concentrate 58 percent of all the clinics in the province. On average, there is one clinic for every 13,000 population or so, but inter-district variation is considerable. In Chishti Sharif, population density per clinic is about 4,200, and in Hirat 9,200 or so, but in Adraskan it is 28,000. In the absence of information on the capacities of such clinics in terms of medical staff, equipment, etc., it is not possible to draw any conclusion as to whether or not the absence of hospitals in the 13 districts that have none is actually compensated to some degree but the presence of clinics.

Doctors' practices are much more frequent than clinics—218, as compared to 137. But they are non existent in two—Adraskan and Fersi. Concerning population density per

doctor's practice, it varies from about 2,700 in Hirat to about 91,000 in Pashtun Zargun, the average at province level being about 8,000, as compared to 13,000 for clinics.

Pharmacies exist in all districts; they number 834, and even though three-fifths of them are concentrated in the sole district of Hirat, their spatial distribution is notably more even than for clinics, hospitals, or doctors' practices. The provincial average is one pharmacy per every 2,100 population or so. The lowest density is in Hirat (775), but inter-district variation is not as wide as for the clinics or Doctors' practices. In Adraskan it is about 7,000 and in Gulran about 6,000, but in the remainder of the district, it ranges from about 2,000 to about 5,000.

Factories & workshops

The province Hirat has 4,422 factories/workshops¹. They exist in all districts with no exception. Population density per factory/workshop is about 400; but inter-district variation tends to be wide. In the district of Hirat, there is one such business for 127 population, whereas in Adraskan there is one for as many as 5,100. Excluding this last extreme, the highest density is 2,450 in Kushk-i-Kuhna.

Bakeries and Mills

Bakeries do not appear to be as present in Hirat as one would expect, except in Hirat which houses 427 of the total of 568, i.e., three-fourths. The remainder is distributed among all the districts except Khushk-i-Kuhna. On average, there is one bakery for approximately 3,100 population or so; but variation between district is quite substantial. Excluding Gulran, it goes from about 900 in Hirat to more than 28,000 in Fersi. In Gulran, there is one bakery for the total population of 106,983 population.

¹ This category of buildings refers to a variety of small-scale businesses: repair shops for bicycles, motorcycles, radio/TV, gas and light stoves, musical instruments, weapons, pressure cookers, typewriters, refrigerators; electric workshops, car workshops; juice-making shops, shoe-making shops, briefcase-making shops; electric products factories, plastic shoes and sandals factories, ice-making factories, fruit-processing factories, metal factories, and building companies.

Mills, on the other hand are much more numerous—they number 1,726—and more evenly distributed over space. The average across the province is one mill for every 1,000 population or so. Inter-district variations exist without being excessive: in Hirat, it is 3,800; in Injil 1,400, and in Adraskan 1,000; but in the remainder of the provinces, it fluctuates between 600 or so and 900.

In conclusion, it may be fair to hypothesize that because of geographic remoteness, households in a majority of villages in certain districts make their own bread at home.

Hotels & Restaurants

There is a total of 2,451 hotels and restaurants in the province of Hirat, distributed over all the districts with non exception. Their numbers vary from 2,204 in Hirat (nine out of ten) to two in Kushk-i-Kuhna. At provincial level, there is one hotel/restaurant for every 719 population, but in Hirat there is one for every 180 inhabitants, whereas in Injil, Kushk-i-Kuhna, and Gulran there is one for respectively 22,000; 21,000; and 13,000.

The information available does not give any indication as to the nature of such establishments. It would appear that in predominantly rural settings, hotels and restaurants are mere stopping places for travelers in need of a meal and a place to spend the night. It follows that those districts with relatively more such places tend to have more visitors than the others.

Shopping places

Food & grocery, and clothes & textiles stores are the most prevalent businesses in any of the districts of Hirat. On average, there is one grocery store for every 123 population; and one clothes & textile store for approximately 337. Inter-district variation is minimal for food and grocery store; it goes from one store for every 66 population in Hirat to 265 in Gulran. For clothes & textile stores, however, it goes from one per 95 population in Hirat, to one per more than 12,300 in Nizam-i-Shahid.

Construction materials stores tend to follow a similar spatial distribution as for grocery and textiles. They total 1,331, of which 1,047 are in Hirat. The average at province level is one store per 1,300; but in Hirat, it is as low as one per 380.

Mosques

The province of Hirat counts a total of 5,317 mosques, i.e., an average of one mosque for every 331 population. Variation around this mean is not large, especially if we discount Hirat, where the average is one mosque per 678 inhabitants.

Other places

The whole province of Hirat counts 60 poultry and livestock farms: 56 in Hirat, one in PashtunZarghun, one in Fersi, and two in Kushk.

Barbers and beauty salons exist in 11 of the 16 districts. They are absent only in Kushk-i-Khuhna, Chishti Sharif, Fersi, Adraskan, and Zendajan. The majority, however, is in the provincial center, which concentrates 187 of the total 235.

It would appear that in rural setting, barbers tend to do move from one place to the next, following weekly markets, or from home to home on demand.

Annex 4

Procedure for adjusting the reported age distribution

To adjust for the irregularities of the age-sex distribution, we adopted the following three-step procedure.

- Step 1. The reported age-distribution was submitted to the Arriaga technique of age-smoothing.
- Step 2. Using a stable population model¹, the distribution obtained in step 1 was corrected for the pronounced sex-imbalances in the 0-4 to 10-14 age groups. While this procedure yielded the desired result in terms of sex ratios, it increased the size of the male population and decreased that of the female.
- Step 3. In order to maintain the totals by sex as reported in the household listing tables, the distribution for males was multiplied by a negative factor and that for females by a positive one. The factors were obtained by dividing the adjusted population for each sex by the reported one.

¹ The model used was from the Regional Model Life Tables and Stable Population; Ansley J. Coale and Paul Demeny; Princeton University Press; Princeton, New Jersey; 1966 ("West" model at level 13 for both males and females [e_0 : 50 for females, and 47.114 for males] and a growth rate of 30).

Annex 5
Comparison of the Reported and adjusted age distributions, Heraf, 2003

B—Population Pyramid

Annex 6

Compositional Analysis

Compositional analysis (also called contingency tables) is a statistical procedure that summarizes the relationship between two variables. It consist in cross-classifying the two variables; each category of one variable is assigned to one of the rows, while each category of the other variable is assigned to one of the columns. The result is a table with a series of cells, each of which represents a unique combination of categories. The number of cases—persons, places, etc.—falling into each cell is called a “joint frequency” or “cell frequency”. When the cell frequencies are summarized by rows, the row totals are often termed “row marginals”. Similarly, the sum of cells by columns are called “column marginals”. By definition, the sum of the row marginals is equal to the sum of the column marginals, which is the total number of cases that have been cross-classified. Based on the table thus generated, a series of other tables can be derived that portray the relationship between the two variables in terms of percentages or proportions.

This technique has been applied to the data on economic activities. The result is shown in the panels shown below. The contents of the panels are described as follows:

- Panel A: Raw data—gives the distribution in absolute numbers; individual cells represent the number of villages in a given district (rows) that are engaged in the activity described—producing eggs, honey, carpets, etc. Row totals represent the number of villages in a given district engaged in a given category of activities or products. Column totals represent the number of villages in all the districts producing a given product or are engaged in one type of activity.
- Panel B: Specialization—expresses the probability that a village chosen at random from the total number of villages in a given district is engaged, i.e., specializes in the economic activity described.
- Panel C: Concentration—expresses the probability that a given product selected at random is produced in a given district.
- Panel D: Actual Joint Distribution—is obtained by dividing the cell frequencies by the grand total of all rows or all columns².
- Panel E: Expected Joint Distribution—indicates the proportion of all villages which would fall in each cell of table if products and districts were completely unrelated.
- Panel F: Deviation of the Actual Joint Distribution from the Expected Distribution—is obtained by subtracting the expected values of Panel E from the actual values of Panel D. It shows a pattern of positive and negative values which sum to zero in all marginal totals.
- Panel G: Deviation of Actual from Expected as a ratio to Expected—show the extent to which a district specializes in a given commodity or activity or a given

² For brevity purposes, panels D, E, and F, which serve as intermediate calculations for panel G, have been excluded from annex 6.

commodity/activity is concentrated in a given district, controlling for the number of villages engaged in such activity/commodity³.

To summarize the wealth information contained in the various panels of annex 6, we decided to focus on the last one, Panel G, highlighting those among the 16 districts that specialize in one or more of the various products/activities in a remarkable way.

With regards to subsistence crops, four crops stand out—wheat, which is concentrated in Adraskan and Fersi (respective indices of 1.14 and 1.66), rice, which is concentrated in Injil, Nizam-I-Shahid, and Obe (respective indices of 1.78; 1.19; and 1.05); beans, which are concentrated in Obe; and peas, which are concentrated in Kushk, Gulran, and Christi Sharif (respective indices of 1.59, 1.45 and 1.09). This means, for instance, that corn is 1.14 times more likely to be grown in Adraskan and 1.14 times more likely to be grown in Fersi than in any other villages in any other district chosen at random.

In the area of vegetables, only two produce appear to be more highly associated with some districts than others: potatoes and carrots. Potatoes are associated with Fersi (an index of 1.55); and carrots are also associated with Fersi (and index 2.69).

Concerning fruit, only pomegranates appear to be associated to any sizeable degree with one district: Shindand (an index of 1.33). The rest are so evenly distributed over space that none are associated in any significant way with any district.

Herbal products are produced in so few villages that they don't warrant a compositional analysis. A cursory look at the raw data panel will show what district produces what herb and in what number of villages.

Animal products are so present in all 16 districts and so evenly distributed that only a few districts appear to be comparatively specialized in their production. Fersi is relatively specialized in milk (an index of 1.99); Pashtun Zargun and Adraskan are specialized in dried yoghurt (respective indices of 2.21 and 2.96); and Karrukh is highly specialized in wool (an index of 9.06).

Industrial crops and small industries do not engage so many villages as to warrant compositional analysis. The raw data of annex table 6 provide enough information on what is produced and where.

As for handicrafts, it will be recalled from section 4 that only four items comprise the bulk of the production: carpets, rugs, jewelry, and shawl-making. All four are significantly associated with all the districts with no exception, but at various degrees of intensity. The indices linking each handicraft with each of the seven districts vary from 1.25 to as much as 49.75; but the strongest degrees of association relate jewelry to

³ It must be stressed that Panel B should be interpreted with caution to the extent that the indexes it shows are summary statistics that need to be related to the raw data in order for them to have their full usefulness in terms of describing the reality on the ground. Stated differently, this means that Panel G should be read jointly with Panel A.

Pashtun Zarghun, Karruck, Adraskan, and Shindand (respective indices of 49.75; 29.85; 21.32; and 18.66). The same spatial pattern applies to carpets, but at relatively lower indices (21.89 for Pashtun Zarghun, 13.13 for Karrukh, 9.38 for Adraskan, and 8.21 for Shindand. Rugs as well as shawls follow the same spatial pattern as jewelry and carpets, but at a much lower degrees of intensity—the indices vary from 1.4 in Shindand to 3.72 in Pashtun Zarghun for rugs, and from 5.78 in Shindand to 15.41 in Pashtun Zarghun. The fact that all districts exhibit relatively high degrees of association with all handicraft items, and that very few of the other products/activities are associated in any significant way with any of the districts indicates that specialization in this specific area of economic activity is done at the expense of the rest of the activities.
