

# Sar-i-Pul

## A Socio-Economic and Demographic Profile

*With the financial and technical assistance of UNFPA*

### **Note**

Some of the information contained in this report, in particular that related to crops and economic activities, as well as the building stock may not be as accurate as one would wish. However, they are the best estimates available at the time of the Household listing exercise. The most logical explanation is that the sources of the information—local informants—may not have been as knowledgeable as they were assumed to be.

*A Socio-Economic and Demographic Profile  
Household Listing—2004*

## **Acknowledgements**

The Socio-Economic and Demographic Profiles were a collaborative effort of UNFPA, the Central Statistics Office, and numerous stakeholders, who made suggestions for the improvement of the final product while it was still being written.

UNFPA wishes to recognize the contributions of Mr. David Saunders, its former representative in Afghanistan, who shared the various drafts of the model Profile with a number of donors, embassies, and other stakeholders stationed in Kabul and collected their suggestions as to how to improve on it.

The profiles could not have been completed without the commitment, enthusiasm and energetic efforts of many CSO staff members. Mr. Mohammad Haroon Aman, Mr. Waheed Ibraimi, and Mrs Fazila Miri of the Database section produced all the tables and graphics for all 34 provinces. Mr. Tamim Ahmad Shakeb, head of the GIS section, and his colleagues, Messrs Zabiullah Aseel and Abdul Ahmad Sherzai, together produced all the thematic maps included in the body of the text as well as in the annexes—a total of more than 1,300 maps. Messrs Nasratullah Ramzi, Saifrahman Azizi, Sayed Yousuf Hashimi, and Zabiullah Omari of Database were responsible for editing the profiles and putting the last touches before printing.

UNFPA also wishes to extend its appreciation to Mr. Abdul Rashid Fakhri, head of CSO, and his colleagues in the CSO review team—Messrs Esmatullah Ramzi, Mohamed Sami Nabi, Azizullah Faqiri, and Ghulam Mustapha, who read the drafts and made valuable comments and suggestions, in particular with regards to the information on economic activities.

***Introduction by the  
Acting General President of the Central Statistics Office of Afghanistan***

Designing programs aimed at increasing socio-economic development and economic growth to ensure better living conditions for population requires accurate, up-to-date, and comprehensive data. It has been 27 years since Afghanistan's first attempt to conduct a national population census. For reasons known to all, such an attempt had to be aborted. In those 27 years, a number of changes took place, that were related to natural population growth, population movement, and redrawing of the boundaries of the country's administrative units, among others. Such changes need to be apprised and documented, in order to respond to the need for accurate information that is vital for development and reconstruction programs.

Both the Bonn agreement and the emergency Loya Jirga called for the conduct of a second national population and housing census. Jointly with UNFPA, CSO mobilized the required funds from the international donor community, and took charge of the complex task of planning for the census and upgrading the technical skills of the CSO staff that will be responsible for its conduct.

In spite of difficulties of various sorts, and at an enormous cost in terms of staff mobilization, CSO, with the financial and technical assistance of UNFPA, undertook the first phase of the population and housing census. The operation, including door numbering, household listing, updating the enumeration area maps, data entry, cleaning, and processing took less than four years. For the first time, digital maps were produced for all provinces, districts, and village locations.

CSO has the great pleasure of producing this publication, which presents the results of the first phase of the census. It provides such valuable information as population size and spatial distribution, age and sex composition, as well availability of certain facilities to the village populations. We hope that such information will be useful for the widest audience, in particular planners, researchers, and any one with an interest in population data.

Abdul Rashid Fakhri,  
Acting General President  
Central Statistics Office,  
Islamic Republic of Afghanistan.

**Introduction by the  
Representative of UNFPA**

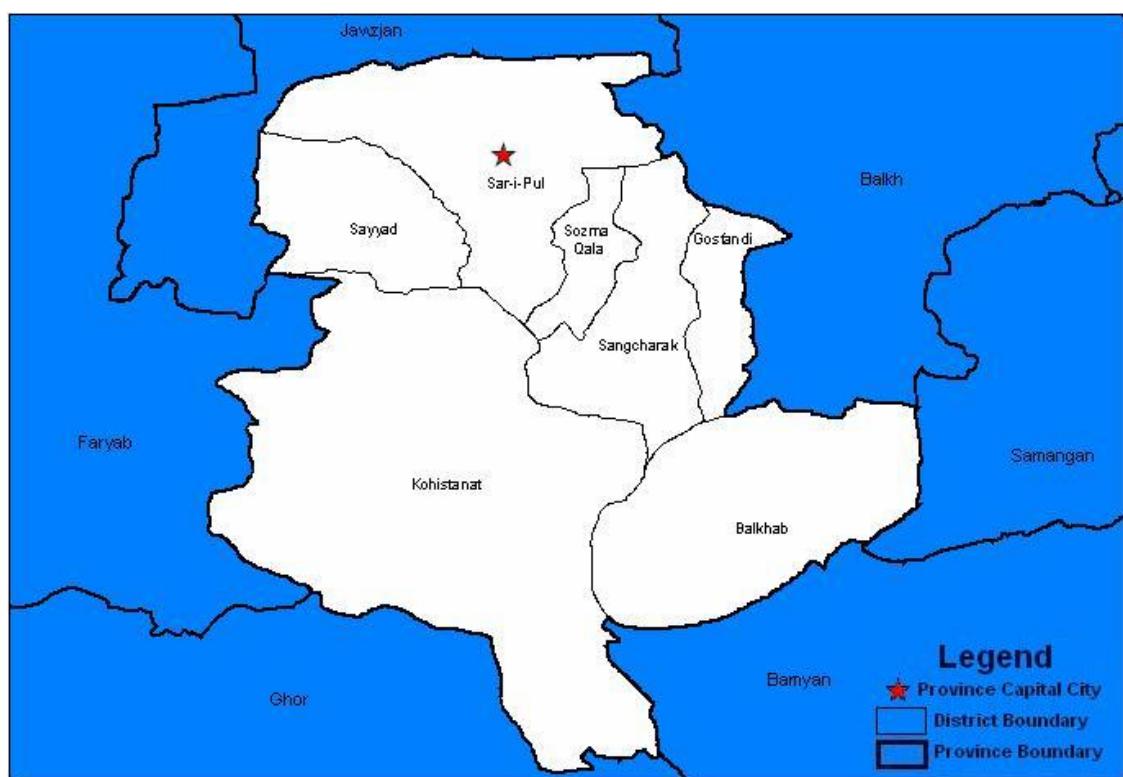

Under the Bonn Agreement, the United Nations agreed to assist the Government of Afghanistan in conducting a Population and Housing Census, the first Census in Afghanistan since 1979. As a leader in population and development issues, the United Nations Population Fund (UNFPA) has been entrusted with this task for its decades of experience and expertise in providing technical and financial assistance in conducting population and housing censuses.

For the past few years, Afghanistan has been making serious attempts at rebuilding and rehabilitating the nation and its institutions after more than two decades of war, conflict, and civil strife. Effective planning for comprehensive social and economic development requires evidence based and reliable data. Data for economic and social development can come from various sources: sample surveys, administrative records, and various other sources. However, no data source other than a Population and Housing Census will provide primary information about the number and characteristics of Afghanistan's population. Likewise, the Census 2008 will allow for comprehensive gender analysis of population based indicators and will provide the baseline for population and any related functional projections that are crucial for planning.

The present publication deals with Phase I of the Afghanistan census—the Household Listing, conducted and the results analyzed between 2002 and 2005. The data collected during this exercise provides a wealth of information on basic population variables in the country — size of the population, age structure and sex composition, and household size. The household listing has also produced much socio-economic data on economic activities, health and education facilities, housing facilities and so on. All such information will be essential in the process of socio-economic reconstruction in Afghanistan. However, it must be noted that the household listing phase unfortunately could not be conducted in a small number of districts due to the security situation that prevailed then. It is hoped that the census proper, scheduled for the summer 2008 and being a benchmark under the London Compact, will encounter more favorable circumstances and fill the gaps left by the Household Listing exercise. UNFPA will extend all possible assistance to the Government of Afghanistan in order to make the census operation in 2008 a successful one. There are a number of positive aspects, which are important to note in the context of conducting the household listing, particularly noteworthy is the cooperation, which the Central Statistical Office has received from the Provincial Administrations, and the assistance, which has been extended to the CSO staff in all of the provinces. The enthusiasm of all of the staff to undertake very difficult work in exceptionally difficult conditions is equally noteworthy and appreciated, as is the quality of the work. At this point, I would like to extend my gratitude and recognition to Dr. Hamadi Betbout, UNFPA's senior advisor who led the exercise of managing the household listing database and publication of the provincial profiles.

## Settlement Patterns

Located in the Northern Region, Sar-i-Pul is bordered by the provinces of Samangan in the east, Balkh in the northeast, Jawzjan in the north and northwest, Faryab in the west, Bamyān in the southeast, and Ghor in south. It covers a land area of 20,794 squared kilometers, representing 3.19 percent of the total Afghan territory. The province is divided into seven districts—(1) Sar-i-Pul, the provincial center, (2) Sozma Qala, (3) Sayyad, (4) Kohistanat, (5) Balkhab, (6) Sangcharak, and (7) Gosfandi.

Sar-i-Pul is home to 1.9 percent of the total population of Afghanistan. With its 442,261 inhabitants, it is the 22<sup>nd</sup> most populous province in the country (see Annex 1).

The population is distributed among the seven districts as shown in table 1 and figure 1<sup>1</sup>. The largest share of the population—26.1 percent—lives in the district of Sar-i-Pul. The remaining six districts are of approximately equal sizes.

The large majority of the population—93.2 percent—lives in rural areas. The urban<sup>2</sup> population of Sar-i-Pul represents .66 percent of the total population in the country. With its 30,016 urban dwellers, Sar-i-Pul is the 17<sup>th</sup> most urbanized province in Afghanistan,

<sup>1</sup> Figure 1 is comprised of two panels; in addition to panel A which shows the distribution of the population by district, panel B shows the population density of each district. The latter information was included for conventional purposes only, as in the absence of quantified information on proportion of inhabitable land, density figures can be very misleading. Panel B should therefore be interpreted with caution.

<sup>2</sup> Urbanity in Afghanistan is not based on population size. According to the Ministry of the Interior, are considered urban those places whose administrative structures include a municipality, regardless of their population sizes. In the case of Afghanistan all provincial capitals are urban, with the exception of Panjsher and Nooristan, as well as the capitals of some districts.

The urban population is concentrated in two centers—Sar-i-Pul and Sangcharak<sup>3</sup>. Alone, the district of Sar-i-Pul accounts for three-quarters of the urban population in the province.

**Table 1—Population, sex, and sex ratio, by district, province of Sar-i-Pul, 2004<sup>4</sup>**

<i>District</i>	<i>Total</i>				
	<i>Number</i>	<i>Percent</i>	<i>Males</i>	<i>Females</i>	<i>Sex ratio</i>
<i>Provincial Center—Sar-i-Pul</i>	<b>115,463</b>	<b>26.11</b>	<b>59,390</b>	<b>56,073</b>	<b>105.92</b>
Sozma Qala	35,993	8.14	18,051	17,942	100.61
Sawad	47,336	10.70	24,624	22,712	108.42
Kohistanat	72,037	16.29	36,912	35,125	105.09
Balkhab	44,041	9.96	22,654	21,387	105.92
Sangcharak	87,670	19.82	44,287	43,383	102.08
Gosfandi	39,721	8.98	19,859	19,862	99.98
<i>All province</i>	<b>442,261</b>	<b>100.00</b>	<b>225,777</b>	<b>216,484</b>	<b>104.29</b>

Sar-i-Pul's rural population of 412,245 inhabitants is distributed over 803 settlements of varying sizes. The smallest settlement counts as few as six (6) people and the largest as many as 22,526<sup>5</sup>.

Figure 2 shows the distribution of the village population by size-class in the total province (panel A) and in each individual district (panel B).

At province level, the most remarkable feature of the spatial distribution pattern is the relative dominance of large-sized villages, i.e., those with 1,000, which represent 11 percent of all the settlements. Such a proportion is equal to that of villages with 300 population and larger than the proportion of the villages belonging to the smaller size-classes except that of 200 population. The latter represents 15 percent.

<sup>3</sup> Both urban centers are comprised of one *nahia* each.

<sup>4</sup> Enumeration started on 12 May 2004 and ended on 1 June of the same year.

<sup>5</sup> There are two villages with zero population. Such villages appear to exist all over the country.

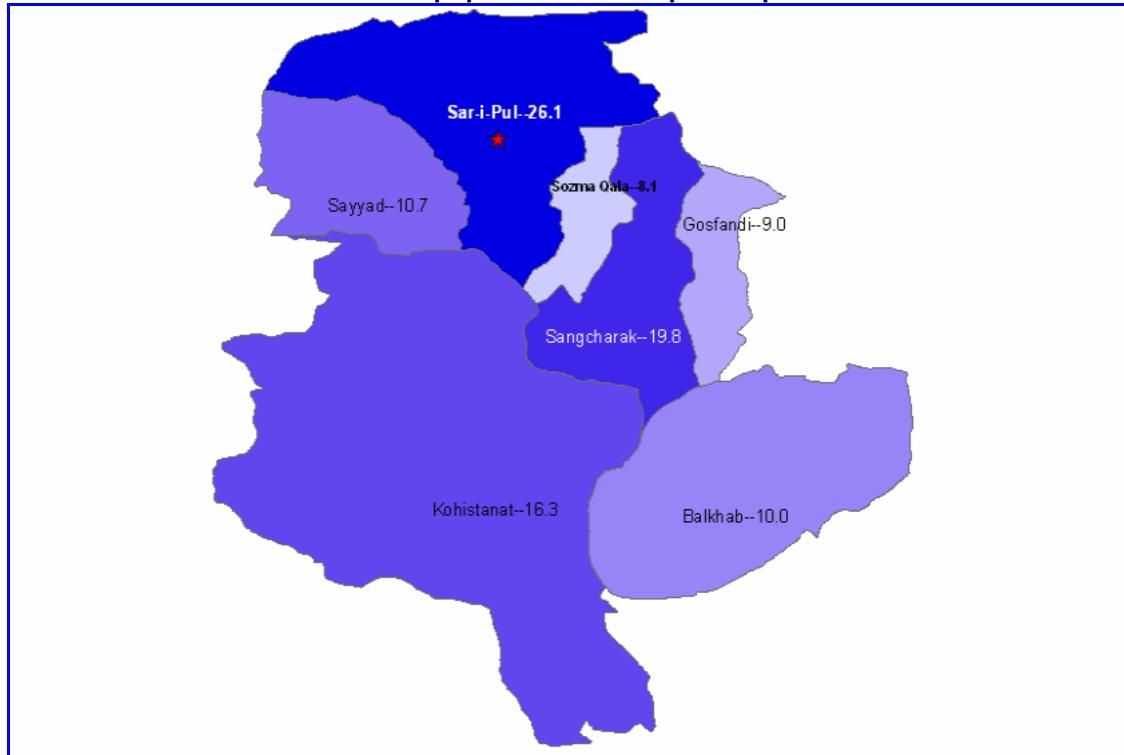

According to CSO, this is due to a variety of reasons:

1. During the household operation, some villages were unoccupied because of the draught which caused the inhabitants to relocate in other places where more water was available;
2. Some of the villages were comprised solely of shops, serving the neighboring villages;
3. In some areas, remoteness as well as economic and other types of problems forced the villagers to relocate to other places;
4. In some cases, the villages are mere district centers with no other types of buildings than government offices and shops.
5. Some villages had been partially demolished, which drove the inhabitants away.

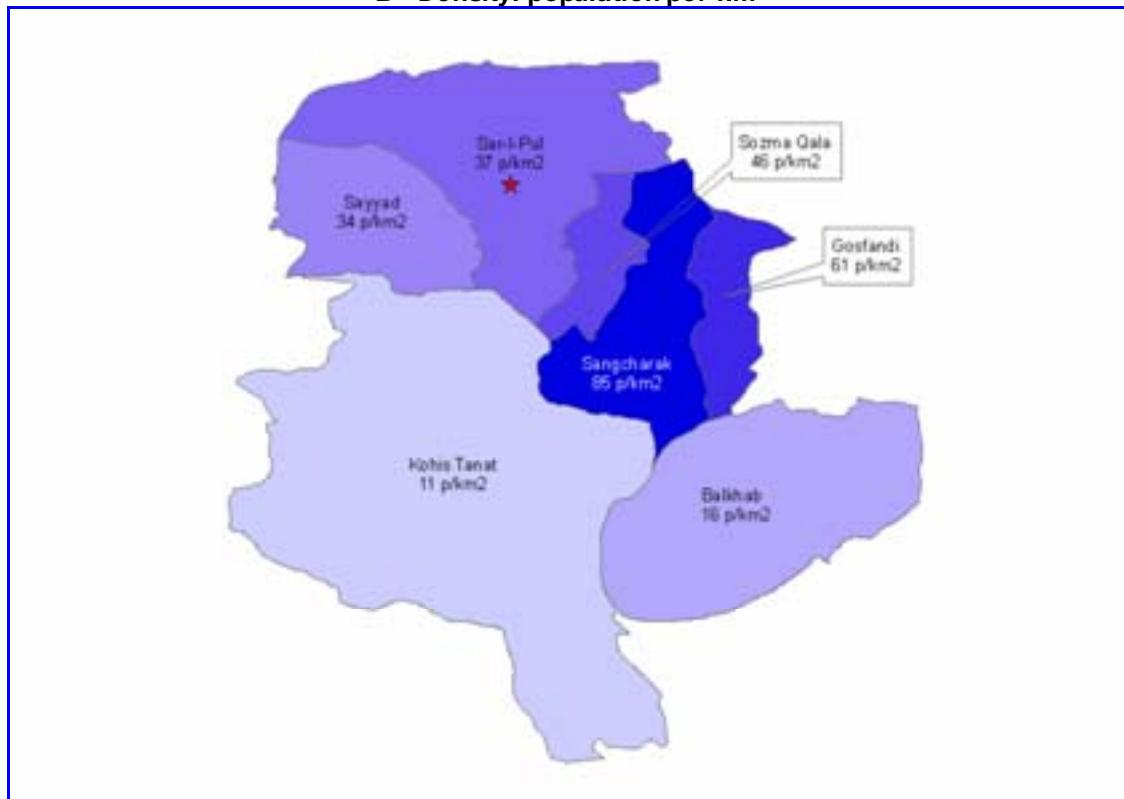

The shapes of the distributions of Sar-i-Pul and Kohistanat are almost total replicas of the distribution described above for the province as a whole. Those of Sayyad, Sangchak, and Gosfandi constitute a cluster of their own, wherein the proportions of large-sized villages are the largest of all. Sozma Qala and Balkhab stand out as having each its own spatial pattern. In the former, the proportions belonging to each of the size-classes are just about equal, whereas in the latter, it resembles very much that of population pyramid with a large base (Figure 2, panel B).

## Demographic Characteristics

### **Age distribution**

The distribution by age and sex of the population of Sar-i-Pul is shown in table 2 and figure 3. As the latter clearly shows, the distribution is highly irregular. The overall shape of the age-pyramid is typical of a pre-transition society—characterized by stable high fertility, but certain age groups are noticeably below the expected size. For instance, it is not readily understandable why the proportions of the 0-4 and 15-19 age groups for males as well as females should be that much lower than the corresponding proportions of the 5-9 age groups, or why the proportion of males 10-14, just to take this one example, is larger than expected, while the corresponding proportion for females is smaller. While a deficit in the proportion of children below 10 could be a direct result of war casualties—women married to soldiers having given birth to fewer children than in normal circumstances, it is difficult to account for the sex-selectiveness of the deficit in the 10-14 age group.

Clearly, the age data need to be adjusted before they can be used for planning purposes.

*“Errors in the tabulated data on age may arise from three different sources:*

- *inadequate coverage,*
- *failure to record age, and*
- *misreporting of age.*

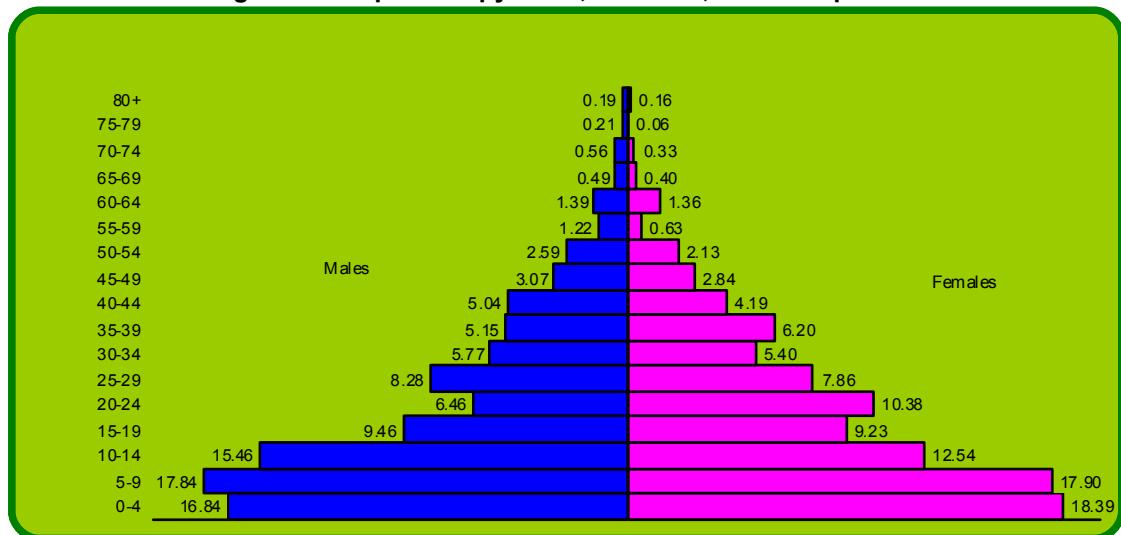

*Coverage errors are of two types. Individuals of a given age may have been missed by the census or erroneously included in it (e.g. counted twice). The first type of coverage error represents gross under-enumeration at this age and the second gross-over-enumeration. The balance of the two types of coverage errors represents net under-enumeration at this age<sup>1</sup>. ”*

---

<sup>1</sup> Because under-enumeration commonly exceeds over-enumeration; the balance is typically designated as under-enumeration.

**Table 2—Population estimate, by age in 5-year groups and sex, Sar-i-Pul, 2004<sup>2</sup>—Reported**

Age Group	Male		Female		Both sexes	
	Number	Percent	Number	Percent	Number	Percent

**Figure 3—Population pyramid, Sar-i-Pul, 2004—Reported**

*"In addition, the ages of some individuals included in the census may not have been reported, or may have been erroneously reported by the respondent, erroneously estimated by the enumerator, or erroneously allocated by the census office. Such errors are referred to as response bias."*

Correction of the age distribution of the 2003 household listing poses certain challenges. In addition to the difficulties described above, one must take into account two additional factors:

1. excess mortality among certain age groups due to the 2001 war, and

<sup>2</sup> The age distribution is based on 1/200 sample of the total households.

2. the waves of war refugees that left for neighboring countries.

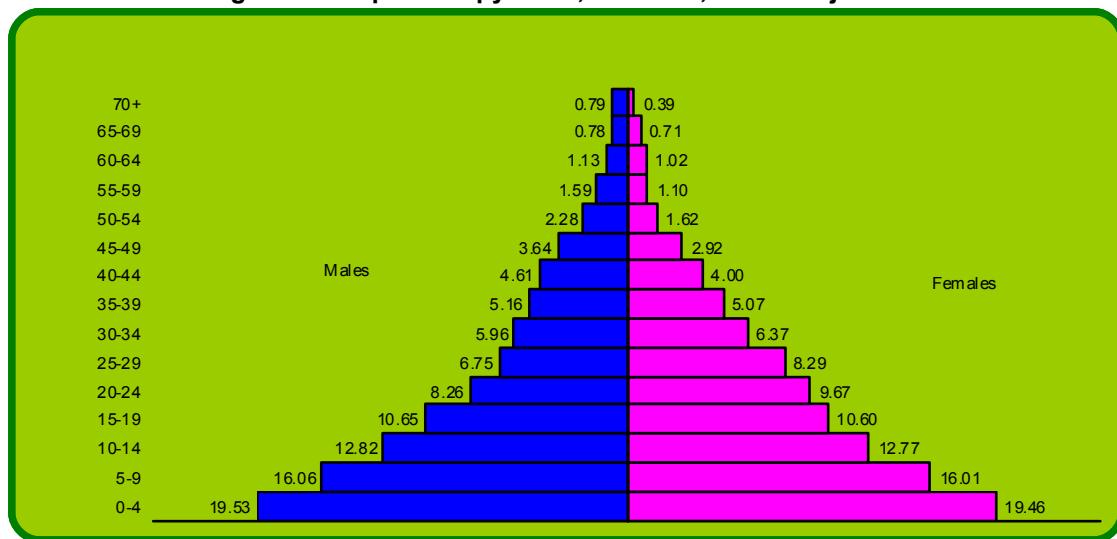

It follows that, in any attempt to correct for the anomalies, care must be taken not to remove the true fluctuations that resulted from such factors.

To correct for these irregularities, we applied a multi-stage procedure<sup>3</sup> that yielded the distribution shown in table 3 and figure 4<sup>4</sup>.

**Table 3—Adjusted population estimate, by age in 5-year groups and sex, Sar-i-Pul, 2004**

<b>Age Group</b>	<b>Male</b>		<b>Female</b>		<b>Both sexes</b>

**Figure 4—Population pyramid, Sar-i-Pul, 2004—Adjusted.**

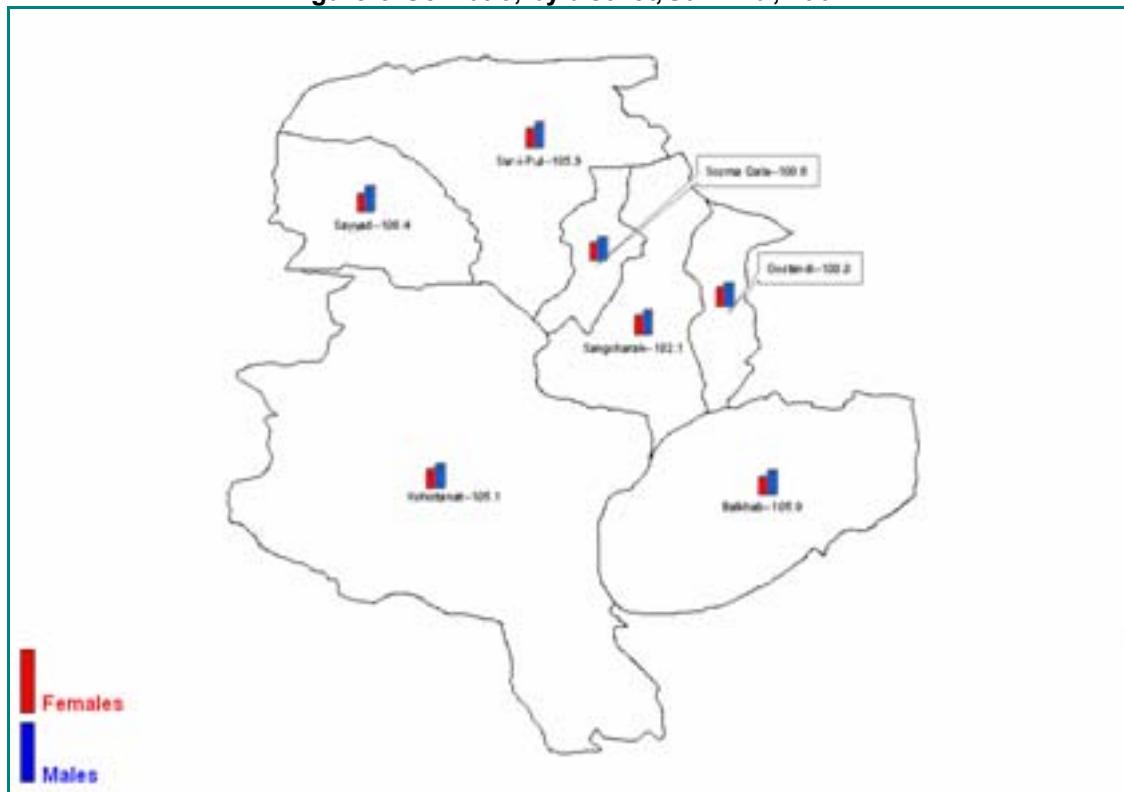

<sup>3</sup> The complete account of the various stages is shown in Annex 2.

<sup>4</sup> For a comparison of the reported and adjusted age-distribution, see annex 3.

### **Household size and sex ratio**

The sex ratio (number of males per 100 females) varies between 100 in Gofzadi to 108.4 in Sayyad (figure 5 below and the last column of table 1). No information is available which could explain this wide variation.

**Figure 5. Sex ratio, by district, Sar-i-Pul, 2004**

A typical household in Sar-i-Pul has 5.6 persons, which is substantially lower than the national average of 6.3, but still an indicator of high fertility.

### **Special age groups**

Planners attach special interest to certain age groups. For fertility analysis for instance, the total number of women 15 to 49 years of age—the childbearing ages—is more significant than others. The population 6 to 12—primary school ages—is important in

educational research and planning. Table 4 presents data for the above age groups as well as for others, based on an interpolation of the adjusted five-year age distribution<sup>5</sup>.

**Table 4—Special age groups by sex, in absolute numbers and percents, Sar-i-Pul, 2004**

### Main languages spoken

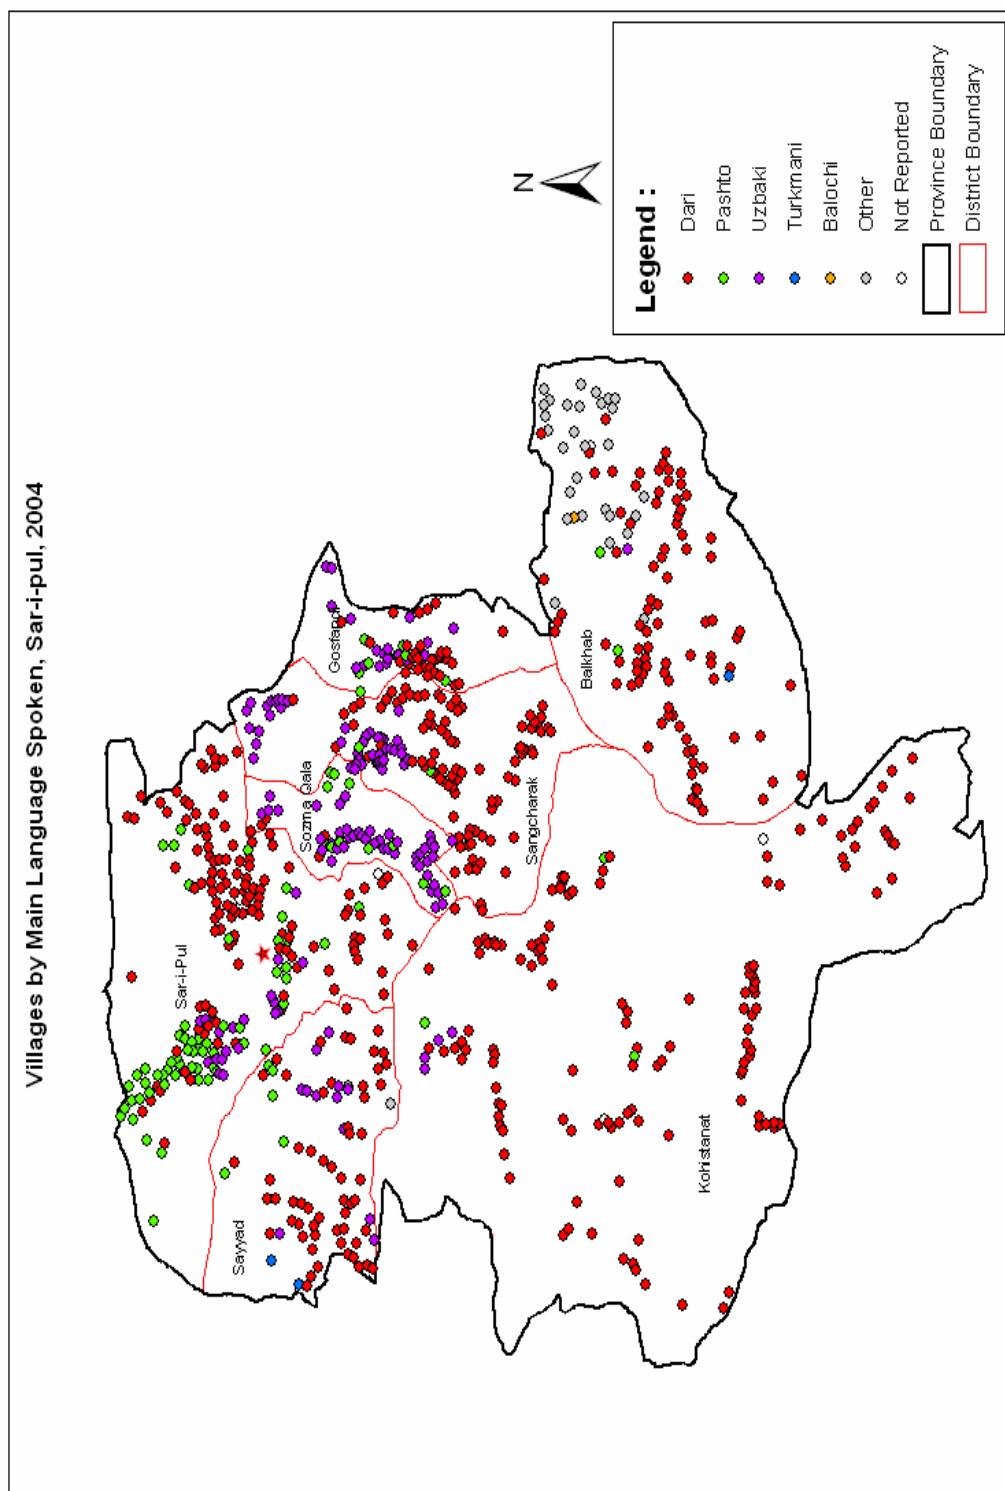

The Household Listing exercise did not collect any information on the ethnic background of the populations. However, it included a question on the languages spoken by the majority of the population in the villages. Of the eight languages listed, Dari is the most dominant (figure 6); it is spoken by about 258,000 population and 525 villages, i.e., 65.4 percent of the population and 63 percent of the villages. The second language is Uzbeki, spoken by 93,000 population and 149 villages—19 percent of the population and 23 percent of the villages. Pashto is spoken by 48,000 population and 88 villages representing respectively 11 percent and 12 percent.

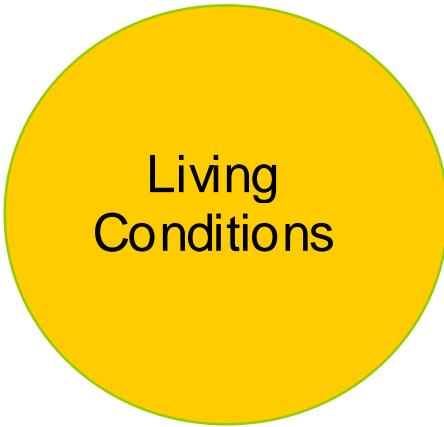

<sup>5</sup> The breakdown of the five-year age distribution into single years of age was obtained using the Karrup-King Third-Difference formula.

**Figure 6—Population and villages, by main language spoken,  
Sar-i-pul, 2004**

Map 2

## Living Conditions

Other useful information concerned the locations of the villages with respect to the provincial center, the types of roads, and the topography.

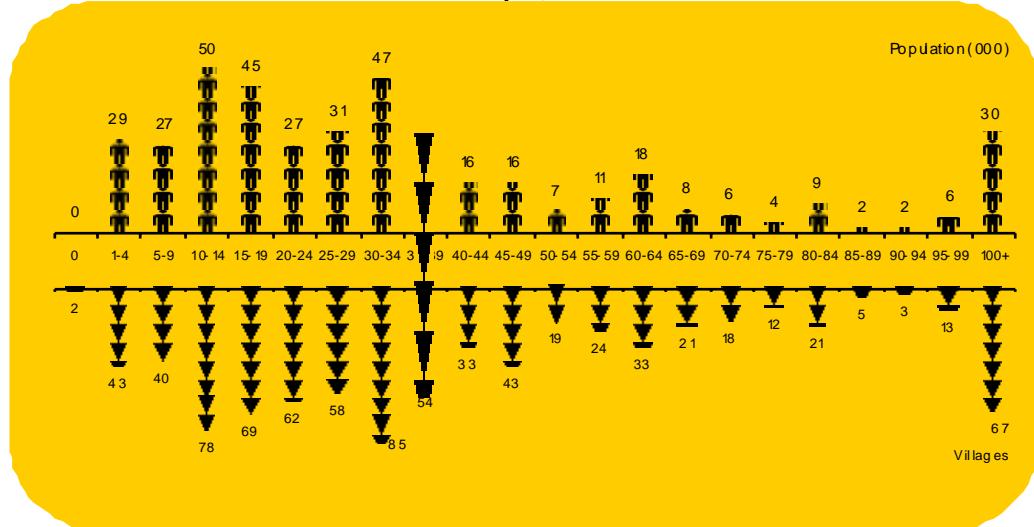

Even though no information was obtained on the social situation of the population, the data collected at village-level make it possible to draw inferences on the availability and/or accessibility of such essential social services as literacy courses; rural schools; primary, secondary, and high schools; health centers and/or dispensaries; drugstores; public phones, mills, as well as radio and television.

Figure 7 shows the numbers of villages by the distances separating them from their respective district centers. Figures 8 and 9 show respectively the types of predominant topography and the types of roads.

The distribution by distances from the district centers clearly does not show a high degree of accessibility with respect to those services that can only be provided by district centers. The population living within 1-4 kilometers from the district center is about 29,000 and that within 5-9 kilometers about 27,000. Together, they don't represent more than 20.5 percent of the total. In sum, half of the population lives at 25-29 kilometers from their respective district centers; and those living at 100 kilometers or more are greater than 30,000, representing 7.4 percent. As figure 8 shows, of the 803 villages, only two are located in flat areas. For the remainder, 114 (14.2 of the population) live in mountainous areas, but the large majority—488 villages representing 58 percent of the

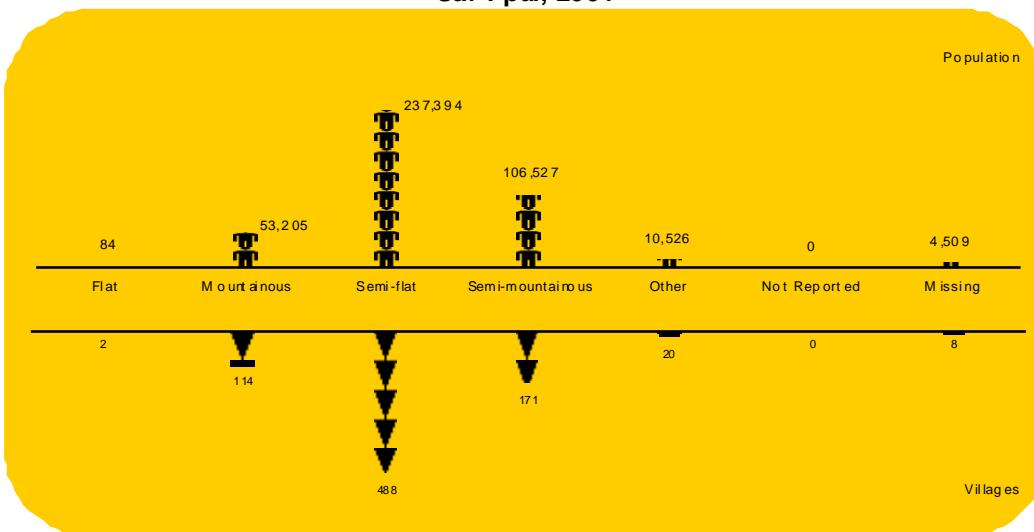

population—is located in semi-flat areas. There is however, no indication that accessibility even for those living in semi-flat areas is easy.

**Figure 7—Population and villages, by distance from the district center, Sar-i-pul, 2004**

Indeed, as figure 9 shows, almost seven persons out of 10 live in villages that are accessible by road only part of the year. Another 16 percent live in localities that don't have any roads at all. It follows that the population living in villages that are accessible by road all year round do not represent more than 15 percent.

**Figure 8—Population and villages, by topography of the village, Sar-i-pul, 2004**

**Figure 9—Population, by type of road,  
Sar-i-pul, 2004**

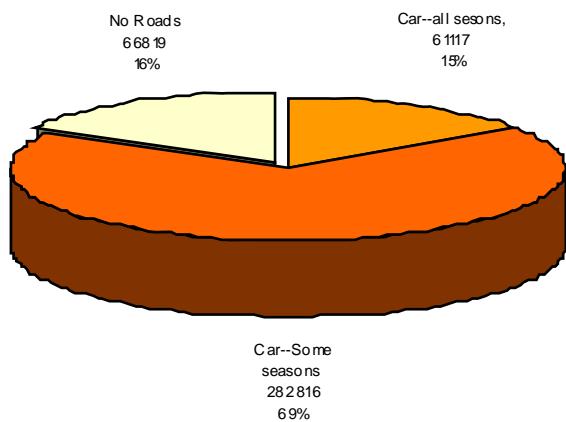

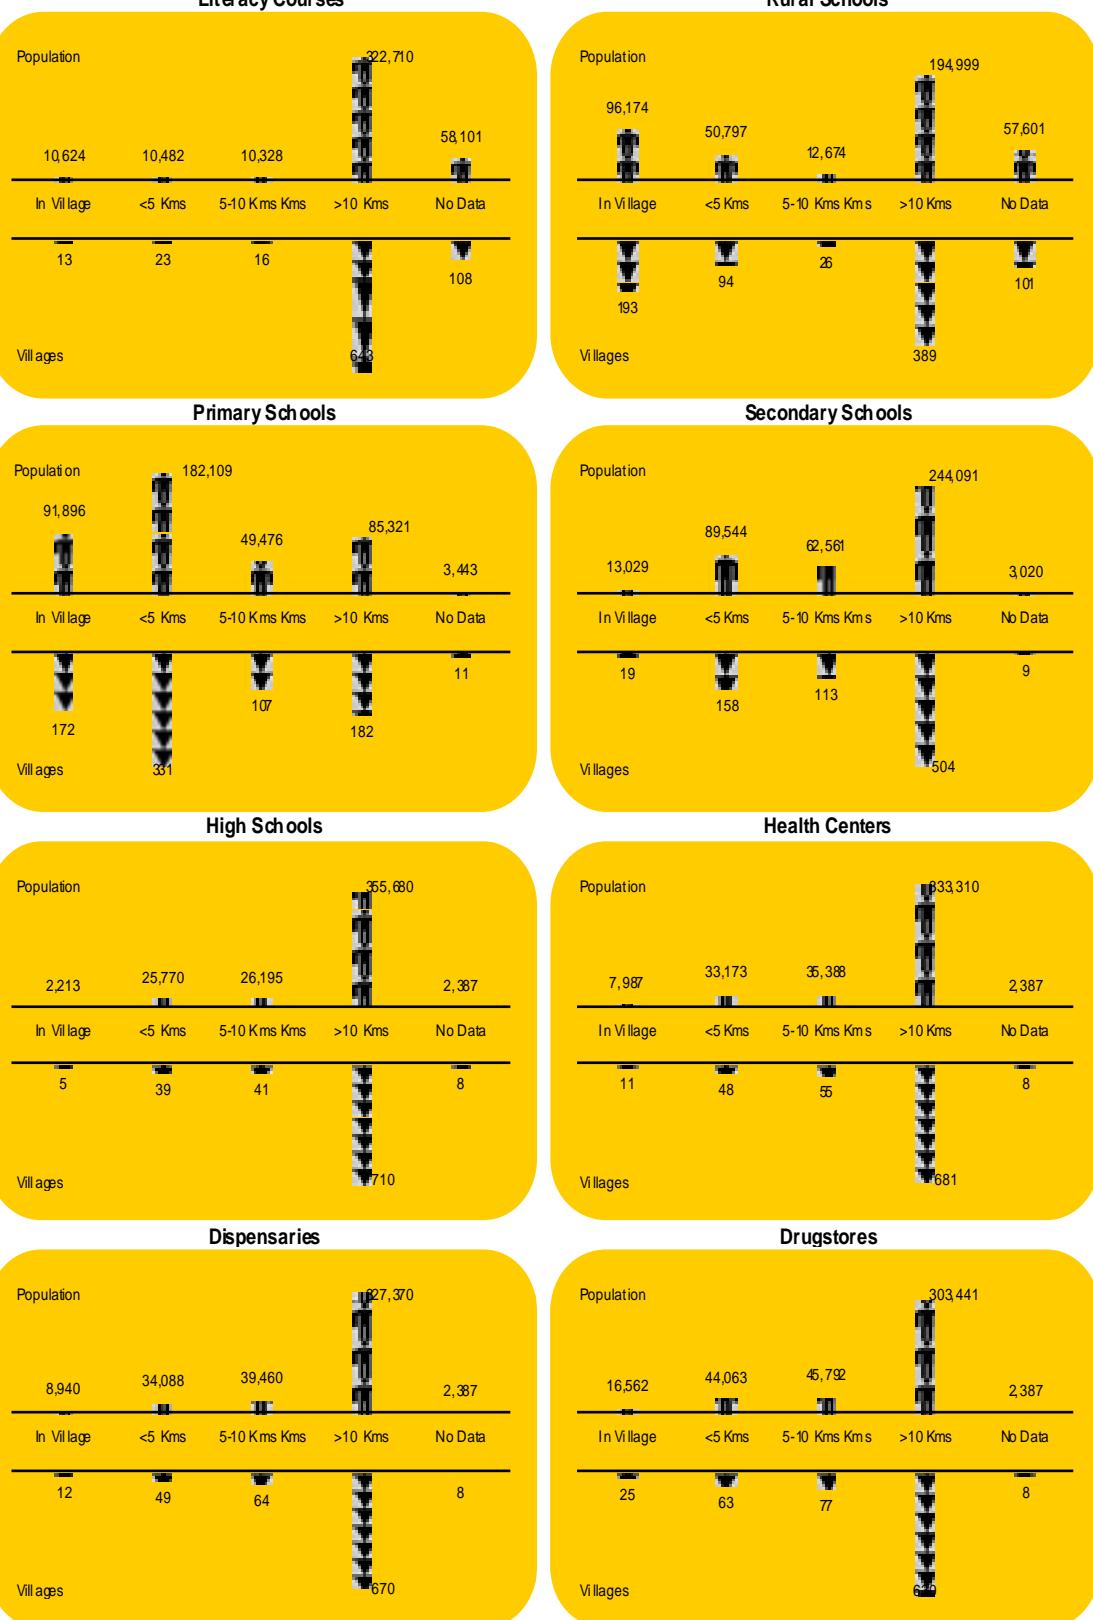

Figure 10 presents information on the distances separating villages from certain social services: schools, health centers, drugstores, post offices, public phones, and mills.

### **Educational services**

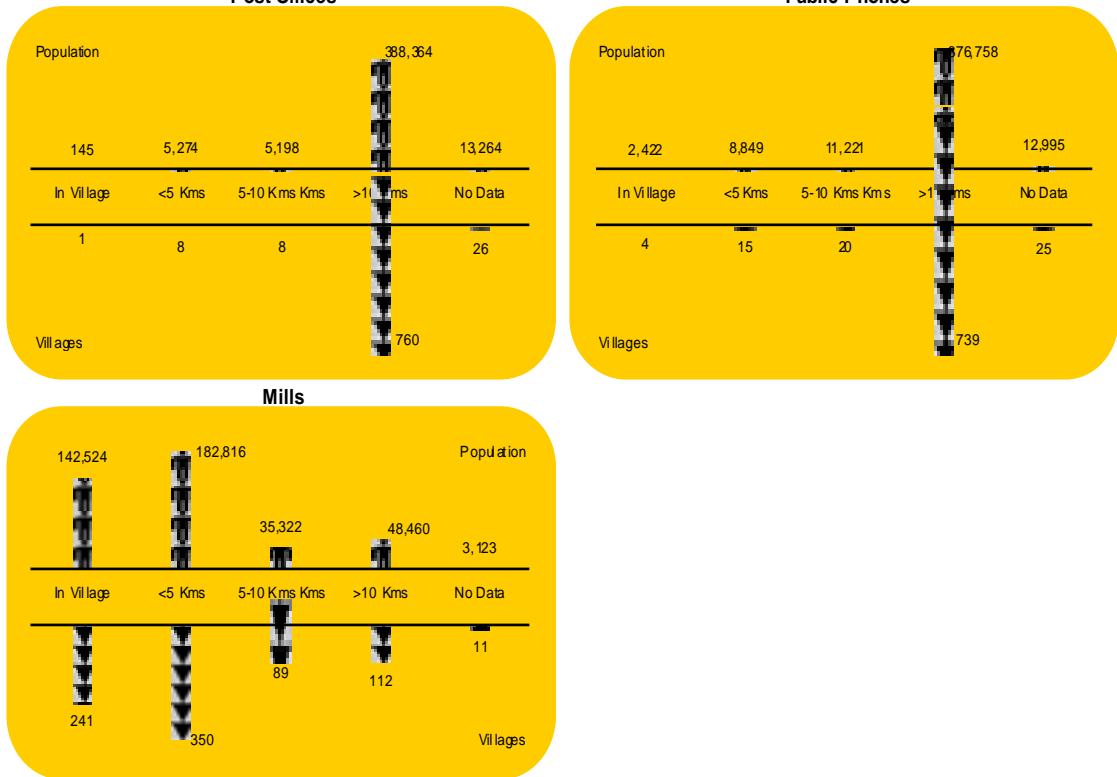

With regard to educational services, accessibility appears to be quite problematic for large segments of the student population, with the possible exception of that of primary schools. Primary schools are located in-village for more than a fifth of the population. For another 44 percent the distance to travel to reach the school is less than five kilometers. It is true nonetheless that for one student out of five the closest primary school is located more than 10 kilometers away.

Secondary schools are substantially less accessible. They are located in village for only 3.2 percent of the students and at less than five kilometers for only 22 percent. Those that must travel more than kilometers represent close to three students out of five. As for high schools, they are accessible for a small minority of the students. They exist in-village for about 0.5 percent of the students, and less than five kilometers away for 6.3 percent. For more than 68 percent, the distance to travel is longer than 10 kilometers.

**Figure 10—Population and villages by distance from certain facilities, Sar-I-Pul, 2004**  
**Literacy Courses**

**Figure 10 (Cont'd)—Population and villages by distance from certain facilities, Sar-I-Pul, 2004**

Accessibility to literacy courses is just about the same as for high schools. There is no guarantee however, that respondents knew exactly what was meant by a literacy course, which explains why 14 percent of them did not answer the question.

Overall, accessibility to rural schools is more difficult than for primary schools and just slightly better than for secondary schools. This type of school exists in village for 23 percent of the population, but at more than 10 kilometers for as many as 47 percent.

### Health services

The spatial distribution of the health infrastructure is quite similar to that of high schools, and it is just about the same for health centers as for dispensaries (panels F & G). The proportions of the population that don't have to travel out of their respective districts to seek medical attention are 1.9 percent for health centers and 2.2 percent for dispensaries. Those who live within five kilometers from a health unit represent a mere eight percent for both facilities. More often than not, people seeking medical attention have to travel

more than 10 kilometers to get it—about four out of five for both types of health units. Drugstores are only slightly less inaccessible. They exist within the villages for about four percent of the population, at less than five kilometers for less than 11 percent, and at more than 10 kilometers for close to three persons out of five (panel H).

### **Post office & public phones**

Out of the 803 villages, post offices exist in one, and public phones in four (panels I & J). On average, therefore, accessibility of both facilities is very difficult. The distance to travel to reach a post office is more than 10 kilometers for 94 percent of the population. To use a public phone, travel distance is more than 10 kilometers for more than nine persons out of five.

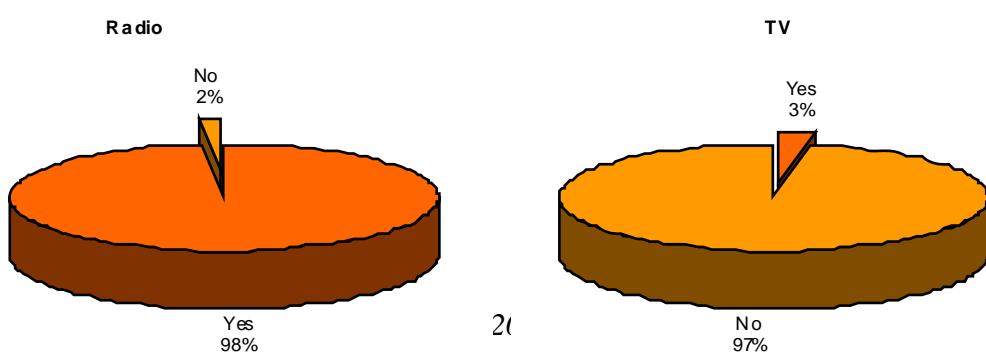

### **Mills**

Mills tend to be relatively more available to the population than any of the facilities mentioned above (panel K). They exist in 241 villages out of the 803, and cater to the needs of slightly more than one-third of the population. Furthermore, 44 percent of the population don't have to travel more than five kilometers to reach one.

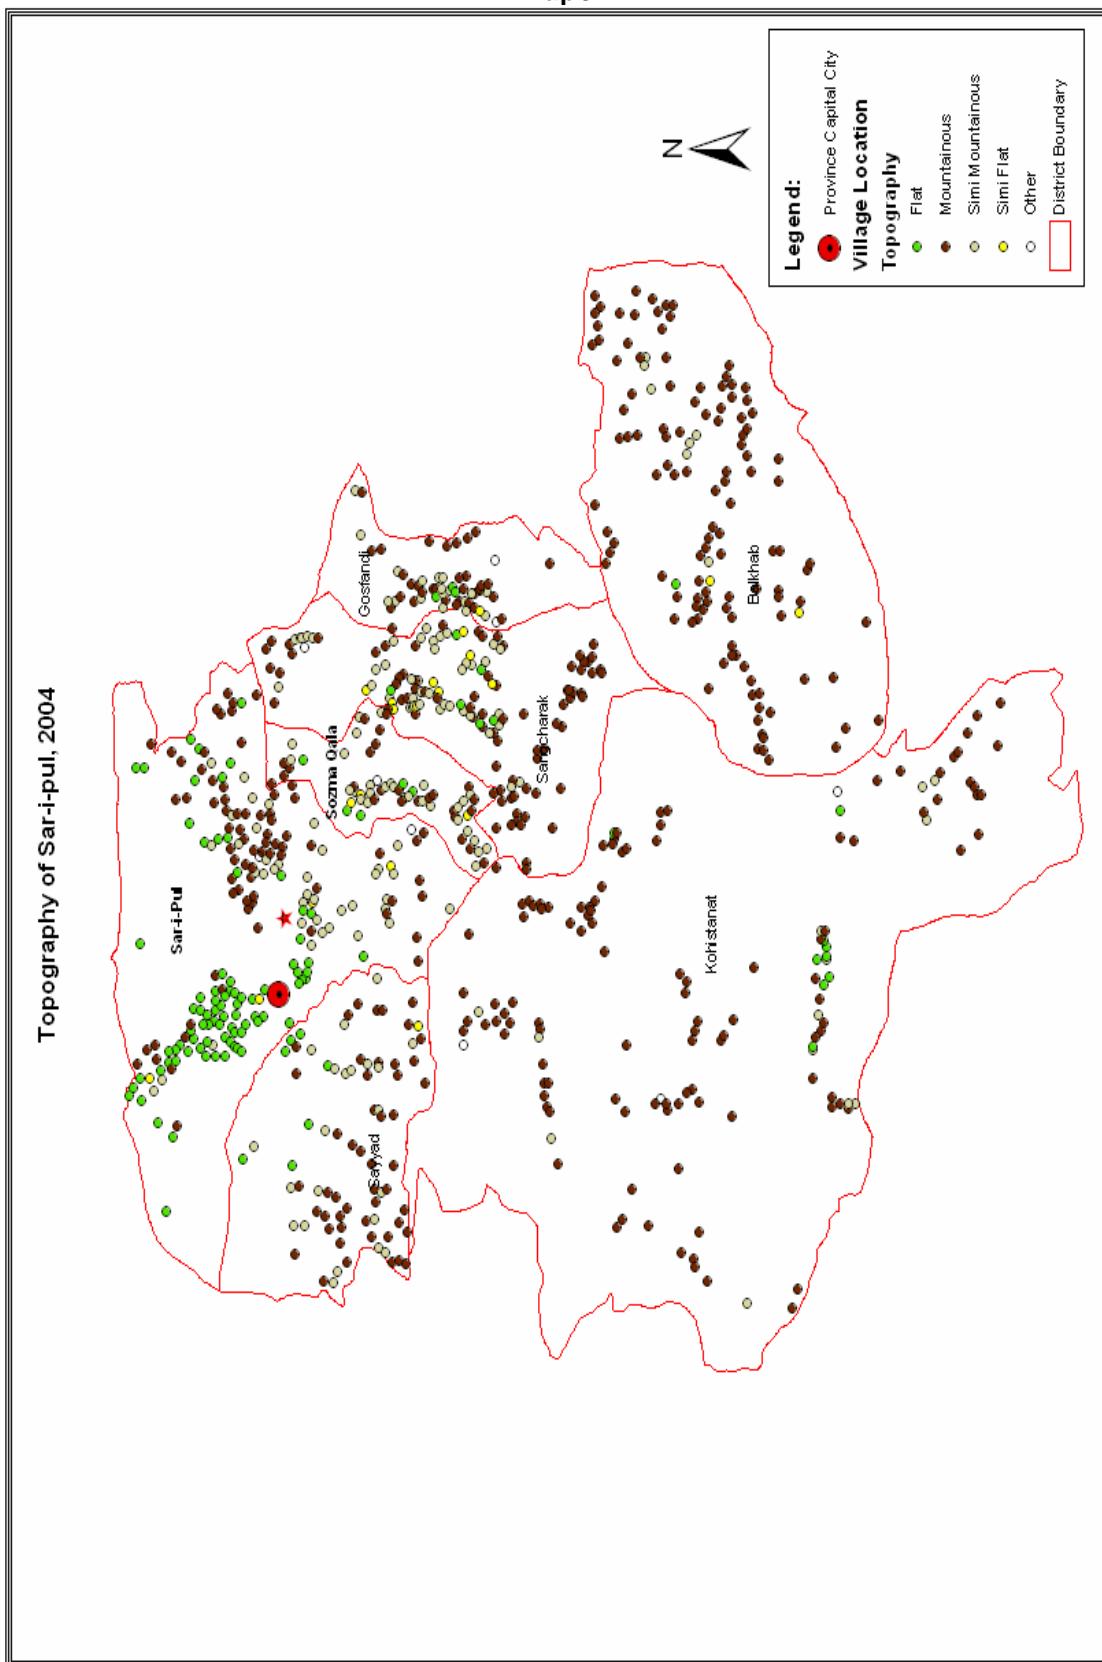

### **Radio & television**

Whereas 98 percent of the population have access to radio, those that have access to TV represent a mere three percent. It goes without saying that public information efforts and media campaigns are seriously hampered by this state of affairs.

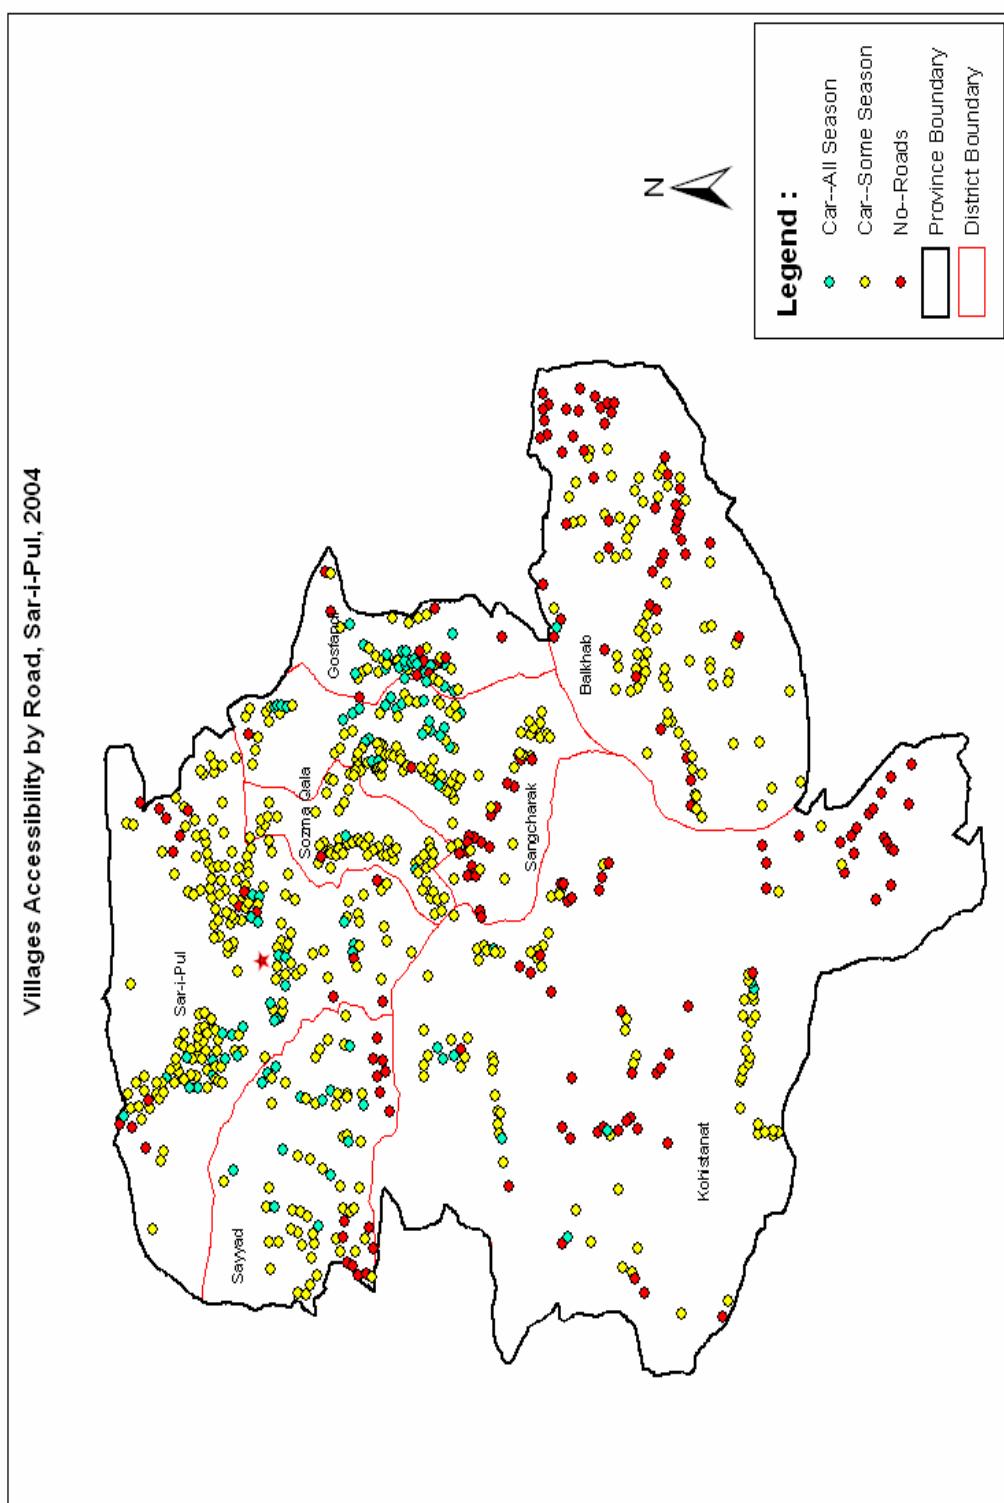

**Figure 11—Proportion of the population living in villages where there are radios or TVs, Sar-i-pul, 2004**

## Economic Activities

In addition to the major sources of irrigation water, the Household Listing data included information on agricultural products, industrial products, handicrafts and small industries—a total of 64 items grouped into eight categories as shown in table 5 below.

Data on economic activities can be analyzed in various ways. The analysis presented here is based on a graphical depiction of the data. A more complex one is shown in annex 4, based on a technique called compositional analysis.

**Table 5—Agricultural, industrial, and animal products, handicrafts and small industries, Sar-i-Pul, 2004**

<i>Subsistence Crops</i>	<i>Industrial Crops</i>	<i>Fruits</i>	<i>Vegetables</i>	<i>Herbal Products</i>	<i>Handicrafts</i>	<i>Small Industries</i>	<i>Animal Products</i>
Wheat	Cotton	Grapes	Potato	Licorice root	Carpets	Honey	Eggs
Corn	Sugar Extract	Pomegranates	Onion	Carav	Rugs	Silk	Milk
Rice	Sugar Cane	Melon/Water m.	Tomatoes	Asfitida	Embroidery	Karakul skin	Yoghurt
Maize	Sesame	Orange	Carrots	Zerk	Pottery	Dried sugar	Whey
Beans	Tobacco	Almonds	Cauliflower	Aniseed	Pelisse	Confection	Dried yoghurt
Vetch	Olives	Walnuts	Spinach	Hyssop	Jewelry	Sugar candy	Butter
Peas	Sharsham	Mulberry	Leek	Chicory	Shawl making	Sugar sweet	Wool
Other	Other	Other	Other	Other	Other	Other	Other

### Agriculture

Figure 12 provides information on the sources of irrigation water; and panels A through F of figure 13 provide information on agricultural products—crops; fruit; vegetables; herbal, and animal products.

Figure 12 clearly shows three predominant sources of irrigation water: rivers, which supply 44 percent of the population with their irrigation water; conduits, which supply

another 29 percent; and *arhads*, which supply an additional 23 percent. Together, the three sources satisfy the needs of close to 96 percent of the population and the villages.

A cursory look at figure 13 shows that, in general, the province of Sar-i-Pul tends to be more agricultural than industrial.

In the area of subsistence crops, out of the 1,819 times that this activity is reported, 757 concerned wheat, and 588 concerned maize. The next most frequent crops are corn (217) and peas (151). Together, these four crops account for 94 percent of all the subsistence crops grown in the province. With regard to the wheat and maize, four districts stand out as housing the largest proportion of villages engaging in their production: Sar-i-Pul, Balkhab, Sangcharak, and Kohistanat. In both crops, they contribute more than three-fourths of the total production in the province. Concerning corn and peas, both Sar-i-Pul and Sangcharak stand their ground, but Balkhab is a major producer of corn, but not peas; it concedes this last function to and Gosfandi.

Vegetables are mentioned by much fewer villages than subsistence crops: 779 as compared to 1,819, i.e., 43 percent. The largest share of the production includes four produce: potatoes, onion, tomatoes, and carrots. The three largest producers of subsistence crops are also the major producers of vegetables: Sar-i-Pul, Balkhab, and Sangcharak. But Kohistanat produces its fair share of potatoes, and Sozma its fair share of carrots.

Fruit, on the other hand are mentioned 1,156 times, i.e., about one and half times more than vegetables. The five largest productions are melons/water melons (379 times), grapes and walnuts (218 times each), mulberries (160 times), and almonds (112 times). Sangcharak and Gosfandi distinguish themselves with respect to all five major fruit. The same is true of Balkhab, except for melons/watermelons. Kohistanat is a major producer of almonds, walnuts and mulberries. Sari-i-Pul is associated with grapes and melons/water melons, Sozma Qala with grapes, and Sayyad with melons/water melons.

Herbal products are not particularly present in Sar-i-Pul—they were mentioned 449 times, as compared to 1,819 for subsistence crops, 1,156 for fruit, and 779 for vegetables. The most frequently mentioned products are caray, asfitida, chicory, and licorice in that order. Sar-i-Pul and Balkhab are major producers of all four products. Gosfandi stands out in licorice, caray, and chicory; Sangcharak in licorice and chicory; and Kohistanat in Asfitida.

Animal products, on the other hand, engage a substantially larger number of the villages than any of the other agricultural activities—3,963, as compared to 1,819 for subsistence crops for instance, i.e., more than twice. All the products from eggs to wool are well represented in the total mix. Three districts stand out as concentrating most of the products: Sar-i-Pul, Balkhab, and Sangcharak. Together, they house 62 percent of tall the villages producing any animal product.

### ***Industrial crops, small industries, and handicrafts***

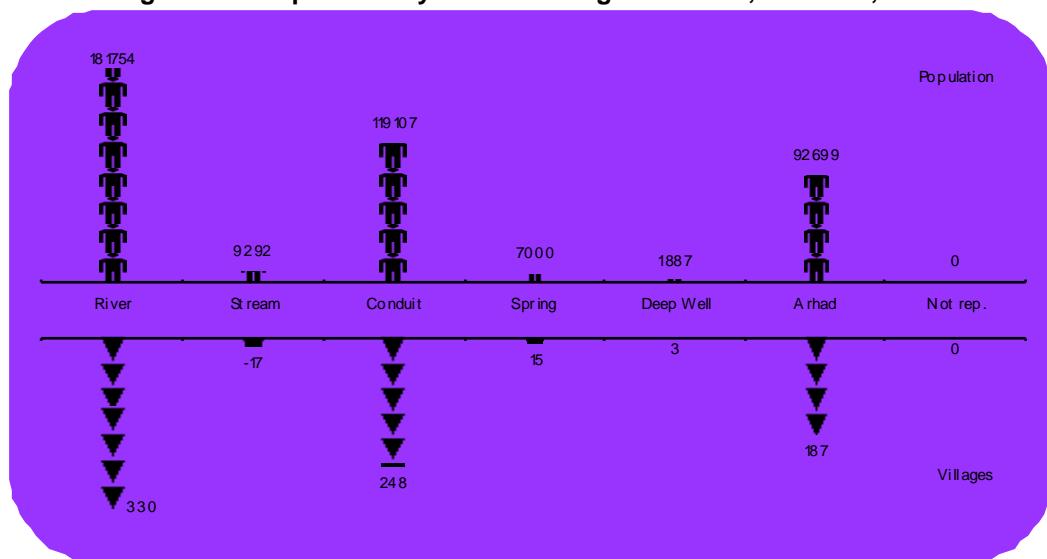

Industrial commodities—cotton, sugar, sesame, tobacco, olives, and sharsham, etc.—are mentioned a little more often than herbal products—475 times, as compared to 449. Only three products are worth mentioning: sesame (224 times), tobacco (81 times), and cotton (65 times). The major producers are Sar-i-Pul, for all three, but in particular cotton and sesame (respectively 62 percent and 49 percent of the villages growing these two crops are located in it); Balkhab and Gosfandi for sesame and tobacco; Balkhab for cotton and tobacco; and Sozma Qala for cotton and tobacco.

For all practical purposes, the sector of small industries is nonexistent in Sar-i-Pul, with the exception of karakul skin, produced in 41 villages, and silk in two. The former is particularly concentrated in Sar-i-Pul: 28 out the 41 villages, i.e., 68 percent.

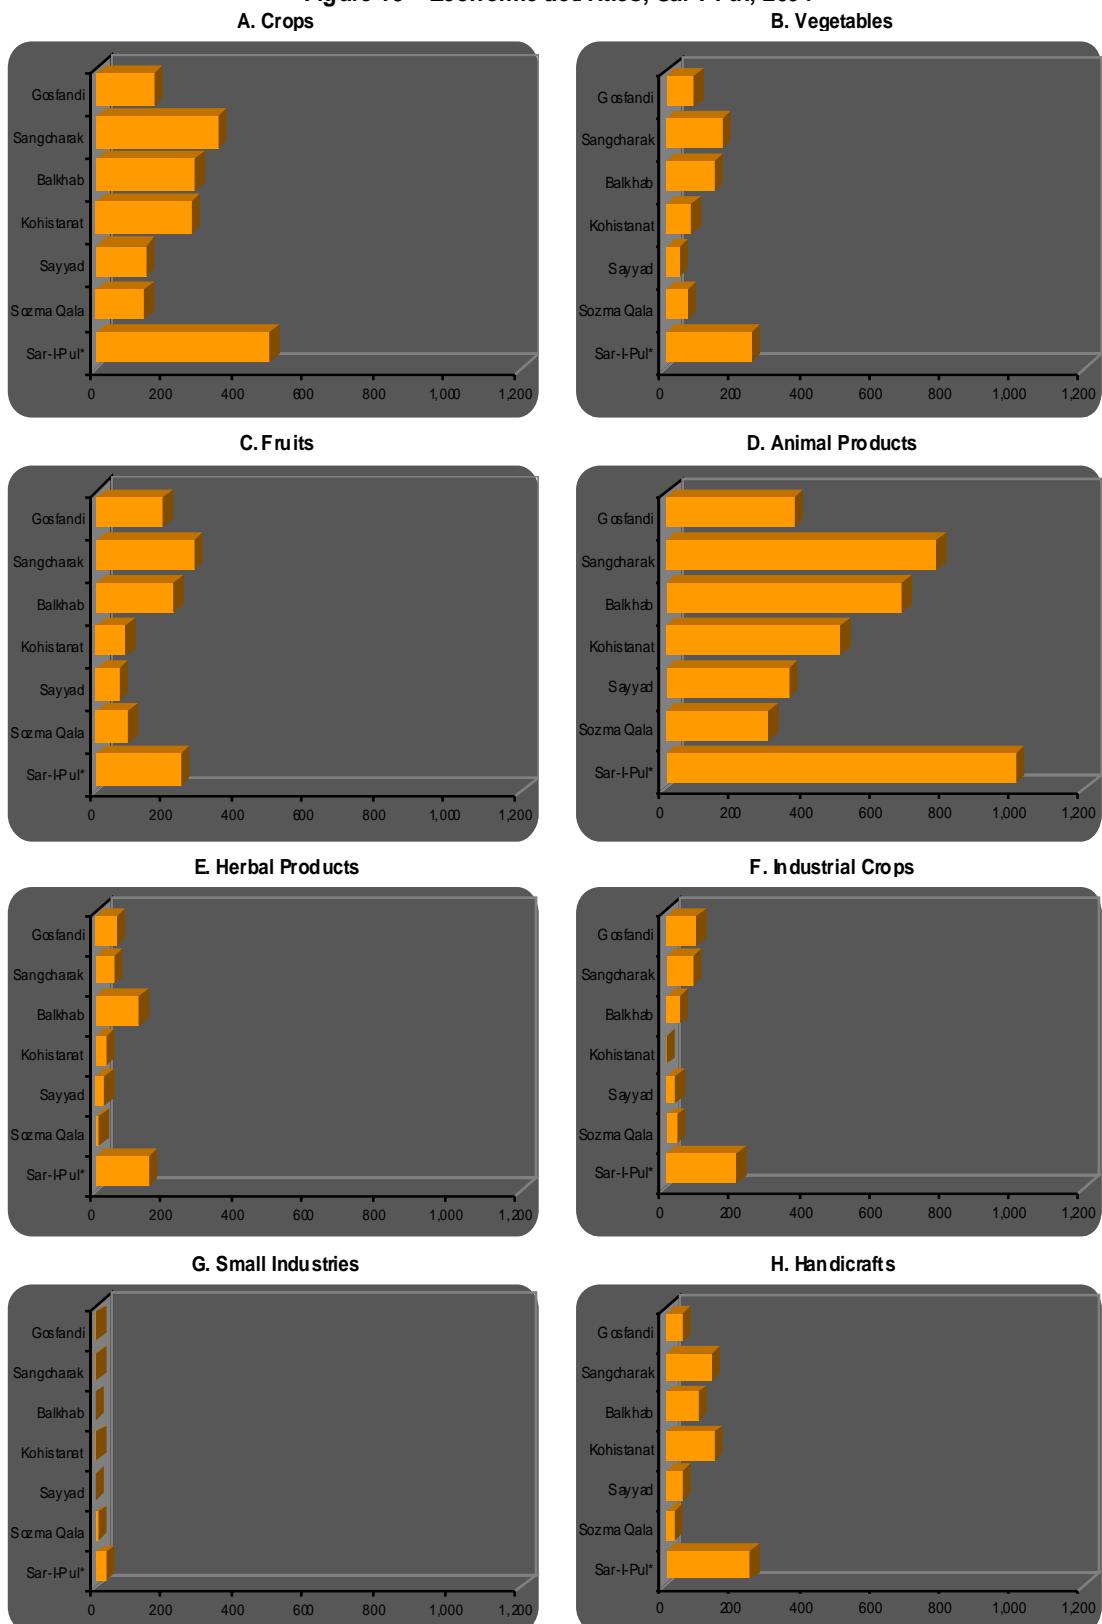

The sector of handicrafts is dominated by rugs, mentioned 352 times out the total of 726, i.e., almost half. Three other items are also produced in reasonable numbers of villages: jewelry (157), shawl-making (104), and carpets (90). Rugs are produced in large numbers of villages in four district—Sar-i-Pul, Kohistanat, Balkhab, and Sangcharak, but

especially the former, which accounts for close to a third of the all the villages. The same pattern applies to the other three items, except shawl-making, which engages fewer villages in Balkhab than the other three handicrafts.

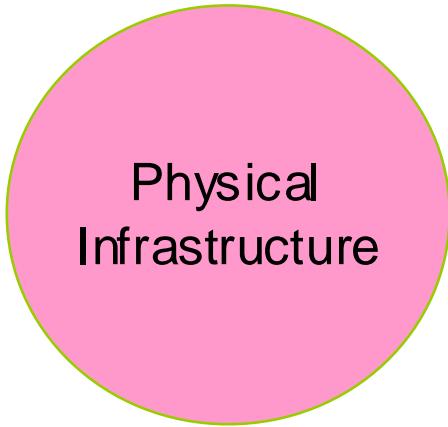

**Figure 12—Population by source of irrigation water, Sar-i-Pul, 2004**

**Figure 13—Economic activities, Sar-I-Pul, 2004**

\* = Provincial Center

The Household Listing operation collected a large amount of data on the physical infrastructure in the provinces. A total of more than 300 different types of buildings were counted, that were later grouped into 17 categories—housing units, schools and educational institutions, mosques, mills, etc. (see figure 14).

The total number of buildings counted was 55,776 in the whole province, of which 88 percent (48,995 buildings) were housing units. The remaining 12 percent (6,781 buildings) represented the rest of the various types of buildings. Such a proportion of housing units is lower than in most of the remaining 33 provinces.

The number of buildings in a given locality is essentially a function of the size of the population living it. To control for this variable, we divided the total population by the number of buildings, thus obtaining a measure of the extent to which living space, amenities or services—social, economic or otherwise, are available to the population.

### **Housing units**

The largest numbers of housing units are located in Sar-i-Pul and Sangcharak. This is to be expected given that these districts are the most populous among the seven. In terms of persons per housing unit, however, the most crowded district is Sayyad, with 10. Among the rest of the districts, density per housing unit is the same as in the province as a whole, i.e., nine, except in Balkhab where it is one person less.

## **Schools and educational institutions**

There are 130 schools in the whole province. Contrary to expectations, Sar-i-Pul, the provincial center and most populous district has only 21 schools, whereas, Balkhab, which is about three quarters the size of Sar-i-Pul has almost double the number of schools—40. To the extent that there is no information on the sizes of the schools, i.e., the numbers of classrooms in every school, it is difficult to draw any definitive conclusions as to class-density. From the information available, and assuming that schools would tend to be of approximately the same size, especially in the less populated districts, it appears that the highest population density per school is in Sayyad, where there are four schools each serving an average population of 12,000 or so. Sozma Qala comes second, with one school per 6,000 population<sup>o</sup>, and Sar-i-Pul third, with a density of 5,500 population per school. The lowest density is Balkhab—around 1,100, the provincial average being one school per 3,400 population or so.

## **Health infrastructure**

The health infrastructure includes hospitals, clinics, doctors' practices, and pharmacies.

There is only one hospital in Sar-i-Pul, located in the provincial center<sup>1</sup>. In terms of clinics, however, the situation is much better. There is a total of 17 units of them, distributed over all the districts, except Sayyad. Some districts are much better off than others—Sar-i-Pul (seven clinics) and Sangcharak (four clinics). Controlling for population, the average number of potential clients per clinic shows substantial variation—from one clinic per 16,500 population or so in the provincial center, to one per 44,000 in Balkhab. The average in the province is one clinic per 26,000 population. This is a higher density than in many other provinces.

Doctors' practices are a little less frequent than clinics in Sar-i-Pul. There are 14 of them, distributed over three of the seven districts. In addition to Sar-i-Pul which counts as many as 12, one for 9,600 population or so, there is only one doctor's practice in Kohistanat,

---

<sup>1</sup> At the time of the data collection, the hospital was under renovation.

catering to the needs of the 72,000 or so population, and another one in Balkhab serving 44,000 population. Overall, a Doctor's practice in the province has a potential clientele of close to 32,000.

With regard to pharmacies, they are much more present than clinics or doctors' practices—they number 88, distributed among all seven districts at the rate of one pharmacy for every 5,000 population or so. Except in Sayyad and Kohistanat, population density per pharmacy hovers around 3,000 to 5,000. In Sayyad it is as high as 47,000 population, and in Kohistanat 18,000. All districts considered, the potential clientele per pharmacy in the province is about 5,000.

### **Factories & workshops**

There are 321 factories/workshops<sup>2</sup> in Sar-i-Pul. They exist in reasonable numbers in most districts, except Sayyad where there is only six. On average, there is approximately one workshop/factory per a little less than 1,400 population. At district level, excluding Sayyad, and Kohistanat, where population density per workshop is about 8,000 and 3,000 respectively, inter-district variation is not too large. It ranges from about 800 in Sar-i-Pul to 1,700 in Sozma Qala.

### **Bakeries and Mills**

Bakeries do not appear to be as present in Sar-i-Pul as one would expect—a total of 43. On average, there is one bakery for approximately 10,300 population; but variation between districts is quite substantial. Discounting Kohistanat, it goes from about 5,200 in Sar-i-Pul to about 9,900 in Gosfandi. In Kohistanat, it is as high as 72,000 (see table 6).

Mills, on the other hand are omnipresent, even in those districts that have no bakeries. The average across the province is one mill for about 1,400 population. Inter-district

<sup>2</sup> This category of buildings refers to a variety of small-scale businesses: repair shops for bicycles, motorcycles, radio/TV, gas and light stoves, musical instruments, weapons, pressure cookers, typewriters, refrigerators; electric workshops, car workshops; juice-making shops, shoe-making shops, briefcase-making shops; electric products factories, plastic shoes and sandals factories, ice-making factories, fruit-processing factories, metal factories, and building companies.

variations exist without being excessive. Other than Balkhab, where it is as low as 710, population density per mill ranges from 1,200 to 2,600.

In conclusion, it may be fair to hypothesize that because of geographic remoteness, households in a majority of villages in certain districts make their own bread at home.

### ***Hotels & Restaurants***

There is a total of 155 hotels and restaurants in the whole province of Sar-i-Pul, spread out across all the districts, except Sayyad again. Sar-i-Pul counts 75 such establishments, which is about half of the total. Controlling for total population, one finds that the highest availability of hotels and restaurants is in Sar-i-Pul where there is one such place for every 1,540 population. But in Koh Band, one can only expect one hotel/restaurant for about 10,300 population. The average for the province is one hotel/restaurant per 2,853.

The information available does not give any indication as to the nature of such establishments. It would appear that in predominantly rural settings such as that of Sar-i-Pul, hotels and restaurants are mere stopping places for travelers in need of a meal and a place to spend the night. It follows that those districts where there are relatively more such places tend to have more visitors than the others.

### ***Shopping places***

Food & grocery, and clothes & textiles stores are the most prevalent businesses in any of the districts of Sar-i-Pul. On average, there is one grocery store for every 189 population, and one clothes & textile store for approximately 1,134 population; but inter-district variation can be considerable for both businesses. The lowest densities for grocery stores are 134 in Gosfandi, 160 in Sar-i-Pul, and 167 in Sozma Qala, and the highest 250 in Balkhab. For Clothes and textile stores, the lowest is 667 in Sar-i-Pul, and the highest 6,500 in Kohistanat.

Construction materials shops also tend to be frequent especially in the provincial center, Sar-i-Pul—out of a total of 131, 62 are in it. At province level, the population density per shop is about 3,400. At district level, and controlling for population size, Sar-i-Pul and

Gosfandi stand out as having the lowest densities (1,862 for the former and 1,891 for the latter), and Sozma Qala and Sayyad the highest—respectively about 18,000 and 12,000.

### **Mosques**

The province of Sar-i-Pul counts a total of 1,456 mosques, i.e., an average of one mosque for every 304 population. Variation around this mean is negligible, even though in Sozma Qala it is as low as 99.

### **Other places**

There are no poultry or livestock farms in the province of Sar-i-Pul. Given the predominantly rural nature of the province, it is justifiable to hypothesize that household tend to raise their own chicken or other farm animals.

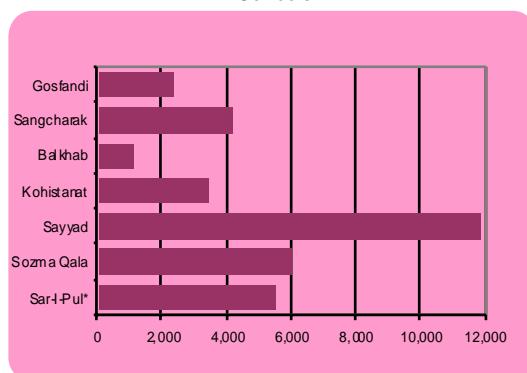

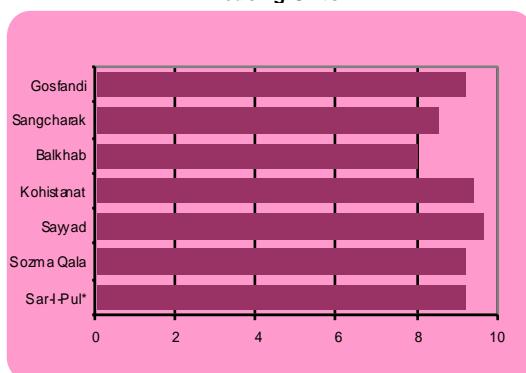

There is a total of 18 barbers and beauty salons in Sar-i-Pul, eight of which are Sar-i-Pul, another eight in Sangcharak, and two in Gosfandi.

It would appear that barbers in rural settings tend to do move from one place to the next, following weekly markets, or from home to home on demand. As for poultry, given the predominantly rural nature of the province, it is justifiable to hypothesize that household tend to raise their own chicken or other farm animals.

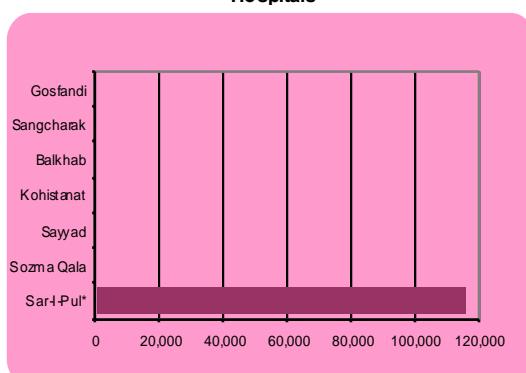

**Table 6—Number of buildings, and population per building, by type, Sar-i-Pul, 2004**

**Annex 4*****Procedure for adjusting the reported age distribution***

To adjust for the irregularities of the age-sex distribution, we adopted the following three-step procedure.

Step 1. The reported age-distribution was submitted to the Arriaga technique of age-smoothing.

Step 2. Using a stable population model<sup>1</sup>, the distribution obtained in step 1 was corrected for the pronounced sex-imbalances in the 0-4 to 10-14 age groups. While this procedure yielded the desired result in terms of sex ratios, it increased the size of the male population and decreased that of the female.

Step 3. In order to maintain the totals by sex as reported in the household listing tables, the distribution for males was multiplied by a negative factor and that for females by a positive one. The factors were obtained by dividing the adjusted population for each sex by the reported one.

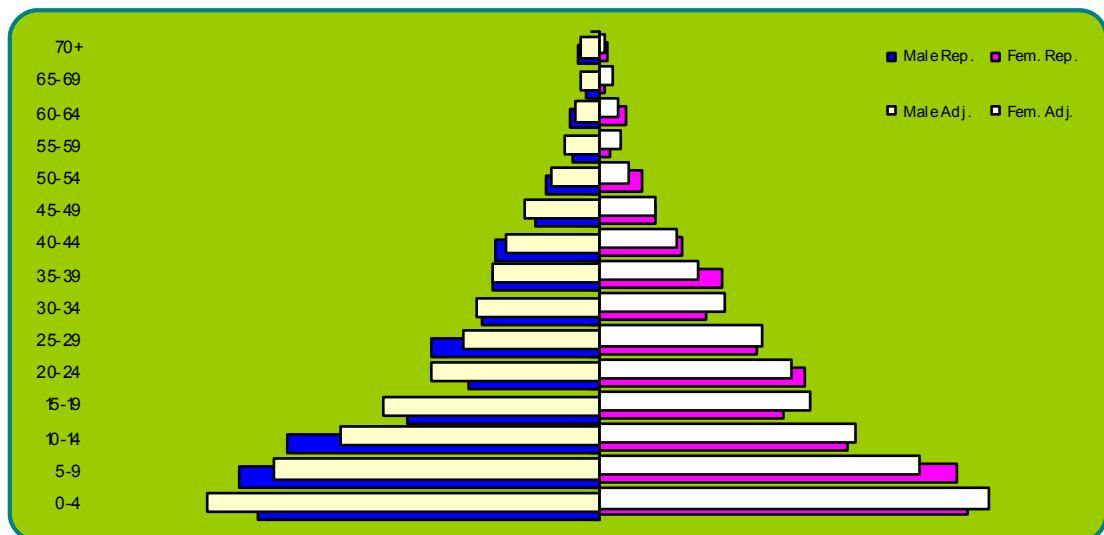

---

<sup>1</sup> The model used was from the Regional Model Life Tables and Stable Population; Ansley J. Coale and Paul Demeny; Princeton University Press; Princeton, New Jersey; 1966 (“West” model at level 13 for both males and females [ $e_0$ : 50 for females, and 47.114 for males] and a growth rate of 30).

**Annex 6*****Compositional Analysis***

Compositional analysis (also called contingency tables) is a statistical procedure that summarizes the relationship between two variables. It consists in cross-classifying the two variables; each category of one variable is assigned to one of the rows, while each category of the other variable is assigned to one of the columns. The result is a table with a series of cells, each of which represents a unique combination of categories. The number of cases—persons, places, etc.—falling into each cell is called a “joint frequency” or “cell frequency”. When the cell frequencies are summarized by rows, the row totals are often termed “row marginals”. Similarly, the sum of cells by columns are called “column marginals”. By definition, the sum of the row marginals is equal to the sum of the column marginals, which is the total number of cases that have been cross-classified. Based on the table thus generated, as series of other tables can be derived that portray the relationship between the two variables in terms of percentages or proportions.

This technique has been applied to the data on economic activities. The result is shown in the panels shown below. The contents of the panels are described as follows:

- Panel A: Raw data—gives the distribution in absolute numbers; individual cells represent the number of villages in a given district (rows) that are engaged in the activity described—producing eggs, honey, carpets, etc. Row totals represent the number of villages in a given district engaged in a given category of activities or products. Column totals represent the number of villages in all the districts producing a given product or are engaged in one type of activity.
- Panel B: Specialization—expresses the probability that a village chosen at random from the total number of villages in a given district is engaged, i.e., specializes in the economic activity described.
- Panel C: Concentration—expresses the probability that a given product selected at random is produced in a given district.
- Panel D: Actual Joint Distribution—is obtained by dividing the cell frequencies by the grand total of all rows or all columns<sup>2</sup>.
- Panel E: Expected Joint Distribution—indicates the proportion of all villages which would fall in each cell of table if products and districts were completely unrelated.
- Panel F: Deviation of the Actual Joint Distribution from the Expected Distribution—is obtained by subtracting the expected values of Panel E from the actual values of Panel D. It shows a pattern of positive and negative values which sum to zero in all marginal totals.
- Panel G: Deviation of Actual from Expected as a ratio to Expected—show the extent to which a district specializes in a given commodity or activity or a given

---

<sup>2</sup> For brevity purposes, panels D, E, and F, which serve as intermediate calculations for panel G, have been excluded from annex 6.

commodity/activity is concentrated in a given district, controlling for the number of villages engaged in such activity/commodity<sup>3</sup>.

To summarize the wealth information contained in the various panels of annex 6, we decided to focus on the last one, Panel G, highlighting those among the seven districts that specialize in one or more of the various products/activities in a remarkable way.

With regards to subsistence crops, among the 28 cells linking the seven districts to the four crops produced in a sufficiently large number of villages, only one stands out, the one associating Gosfandi to peas, with an index of 2.6. This means that a village chosen at random from that particular district is 2.6 times more likely to produce peas than any other village in any other district. By implication, subsistence crops tend to be evenly distributed over space.

Vegetables also tend to be evenly distributed over space. None of the four produce in a sufficiently large number of villages stands out as being associated in any strong way with any district in particular.

Among the five fruit that are produced in a sufficiently large number of villages to warrant compositional analysis, only two appear to be somewhat spatially concentrated: melons/water melons and almonds. Melons and water melons are associated with Sar-i-Pul and Sayyad (respective indices of 1.27 and 1.91), and almonds with Kohistanat (an index of 1.14).

In the area of herbal crops, only licorice appears to be somewhat spatially concentrated. It is associated with Gosfandi (an index of 1.25).

As for animal products, they engage all the districts in much the same way; so much so that none is associated with any district in particular.

Regarding industrial crops, two appear to be spatially concentrated to some extent. Tobacco is relatively concentrated in Balkhab (an index of 2.72) and cotton relatively concentrated in Sozma Qala (an index of 1.21). It must be noted, however, that Kohistanat shows a high degree of concentration with respect to cotton (an index of 6.31), but this is only due to the fact that there is only one village in the district that produces any industrial crop, which, in the present case, is cotton.

Small industries are so scarce in Sar-i-Pul that a mere look at the raw data of annex 6 is enough to identify those districts that produce more of such crops than others.

Of the seven handicrafts surveyed, only four are produced in sufficiently large numbers of villages as to warrant compositional analysis: carpets, rugs, jewelry, and shawl-

---

<sup>3</sup> It must be stressed that Panel B should be interpreted with caution to the extent that the indexes it shows are summary statistics that need to be related to the raw data in order for them to have their full usefulness in terms of describing the reality on the ground. Stated differently, this means that Panel G should be read jointly with Panel A.

making. Sozma Qala is associated with all four of them to varying degrees of intensity: 6.79 for jewelry, 3.06 for carpets, 2.16 for shawls, and 1.47 for rugs. Other districts are associated to some degree or another with one or more of the four handicrafts—Sayyad and Kohistanat with carpets (respective indices of 1.29 and 1.16) as well as jewelry (respective indices of 2.87 and 2.57); and Sangcharak and Gosfandi with jewelry (respective indices of 1.49 and 1.24).
